HEAT OF FORMATION AND SOLUTION

The following table gives the heat of formation of compounds from the elements in their standard states (18° C, 1 atm.) and the heat of solution in water in kilogram calories (mean) per gram-formula weight. To convert to B.T.U. multiply by 3.9685. To convert to kilojoules multiply by 4.186.

Values given are for 18° C and 1 atm. unless otherwise indicated. The heat of solution is given in most cases for a definite number of water molecules to one of the substance. Where this is not stated the dilution is understood to be such that additional dilution produces a negligible thermal effect.

The symbol ∞ indicates that the substance is formed in an "infinite" amount of water.

HEAT OF FORMATION OF INORGANIC OXIDES

The ΔH_o values are given in gram calories per mole. The a, b, and I values listed here make it possible for one to calculate the ΔF and ΔS values by use of the following equations:

$$\Delta F_t = \Delta H_o + 2.303aT \log T + b \times 10^{-3}T^2 + c \times 10^5T^{-1} + IT$$
$$\Delta S_t = -a - 2.303a \log T - 2b \times 10^{-3}T + c \times 10^5T^{-2} - I$$

Ref: Bulletin 542, U. S. Bureau of Mines, 1954.

THERMODYNAMIC PROPERTIES OF ELEMENTS AND OXIDES

THERMODYNAMIC PROPERTIES

Thermodynamic calculations over a wide range of temperatures are generally made with the aid of algebraic equations representing the characteristic properties of the substances being considered. The necessary integrations and differentiations, or other mathematical manipulations, are then most easily effected.

The most convenient starting point in making such calculations for a given substance is the heat capacity at constant pressure. From this quantity and a knowledge of the properties of any phase transitions, the other thermodynamic properties may be computed by the well-known equations given in standard texts on thermodynamics.

Empirical heat capacity equations are generally of the form of a power series with the absolute temperature T as the independent variable:

$$C_p = a' + (b' \times 10^{-3})T + (c' \times 10^{-6})T^2$$

or

$$C_p = a'' + (b'' \times 10^{-3})T + \frac{d \times 10^5}{T^2}.$$

Since both forms are used in the ensuing, let

$$C_p = a + (b \times 10^{-3})T + (c \times 10^{-6})T^2 + \frac{d \times 10^5}{T^2}.$$

The constants a, b, c, and d are to be determined either experimentally or by some theoretical or semi-empirical approach.

The heat content or enthalpy H is determined from the heat capacity by a simple integration over the range of temperatures for which (1) is applicable. Thus, if 298° K is taken as a reference temperature,

$$(2)\quad \begin{aligned} H_T - H_{298} &= \int_{298}^{T} C_p dT \\ &= a(T - 298) + \tfrac{1}{2}(b \times 10^{-3})(T^2 - 298^2) \\ &\qquad + \frac{1}{3}(c \times 10^{-6})(T^3 - 298^3) \\ &\qquad - (d \times 10^5)\left(\frac{1}{T} - \frac{1}{298}\right) \\ &= aT + \tfrac{1}{2}(b \times 10^{-3})T^2 + \frac{1}{3}(c \times 10^{-6})T^3 \\ &\qquad - \frac{d \times 10^5}{T} - A, \end{aligned}$$

where all the constants on the right hand side of the equation have been incorporated in the term $-A$.

In general, the enthalpy is given by a sum of terms such as (2) for each phase of the substance involved in the temperature range considered plus terms which represent the heats of transitions:

$$H_T - H_{298} = \sum \int_{T_1}^{T_2} C_p dT + \sum \Delta H_{tr.}$$

In a similar manner, the entropy S is obtained from (1) by performing the integration

$$\begin{aligned}
(3)\quad S_T - S_{298} &= \int_{298}^{T} (C_p/T)dt \\
&= a\ln(T/298) + (b \times 10^{-3})(T - 298) \\
&\qquad + \tfrac{1}{2}(c \times 10^{-6})(T^2 - 298^2) \\
&\qquad - \tfrac{1}{2}(d \times 10^5)\left(\frac{1}{T^2} - \frac{1}{298^2}\right) \\
&= a\ln T + (b \times 10^{-3})T \\
&\qquad + \tfrac{1}{2}(c \times 10^{-6})T^2 \frac{-\tfrac{1}{2}(d \times 10^5)}{T} - B'
\end{aligned}$$

or

$$(4)\quad S_T = 2.303 \log T + (b \times 10^{-3})T + \tfrac{1}{2}(c \times 10^6)T^2 - \frac{\tfrac{1}{2}(d \times 10^5)}{T} - B$$

where

$$(5)\qquad B = B' + S_{298}.$$

From the definition of free energy F:

$$F = H - TS$$

the quantity

$$F_T - H_{298} = (H - H_{298}) - TS$$

is obtained from (2) and (4):

$$\begin{aligned}
(6)\quad F_T - H_{298} &= 2.303aT \log T - \tfrac{1}{2}(b \times 10^3)T^2 \\
&\qquad - \frac{1}{6}(c \times 10^{-6})T^3 - \frac{\tfrac{1}{2}(d \times 10^5)}{T} \\
&\qquad - (B - a)T + A
\end{aligned}$$

and also the free energy function

$$\begin{aligned}
(7)\quad \frac{F_T - H_{298}}{T} &= -2.303 \log T - \tfrac{1}{2}(b \times 10^3)T \\
&\qquad - \frac{1}{6}(c \times 10^{-6})T^2 - \frac{\tfrac{1}{2}(d \times 10^5)}{T^2} \\
&\qquad - (B - a) + \frac{A}{T}
\end{aligned}$$

In the following two tables there has been collected values of the constants. The first column lists the element or the oxide. The second column gives the phase to which they are applicable. The third, fourth, and fifth columns specify the thermodynamic properties for the transition to the succeeding phase. In column 6, the value of the entropy at 298.16° K, the reference temperature, is given. The remaining columns, except for the last, give the values of the constants a, b, c, d, A, and B required in the thermodynamic equations.

All values throughout the table which represent estimates have been enclosed in parentheses.

The heat capacities at temperatures beyond the range of experimental determination were estimated by extrapolation. Where no experimental values were found, use of analogy with compounds of neighboring elements in the Periodic Table was employed.

THERMODYNAMIC PROPERTIES

VALUES OF CHEMICAL THERMODYNAMIC PROPERTIES

All values of energy given in these tables are expressed, insofar as possible, in terms of the thermochemical calorie, now defined in terms of the absolute joule. 1 thermochemical calorie = 1 calorie = 4.1840 absolute joule = 4.1833 international joule. The notations used in these tables are as follows:

ΔHf° = the standard heat of formation of a given substance from its elements at 25°C.
ΔFf° = the standard free energy of formation of a given substance from its elements at 25°C.
$\log_{10} Kf$ = the logarithm of the equilibrium constant for the reaction for forming a given substance from its elements at 25°C.
S° = the entropy of the given substance in its thermodynamic reference state at the reference temperature at 25°C.
c = crystalline; in certain cases where a substance exists in more than one crystalline form there is an indication as to which form is concerned.
g = gaseous.
am = amorphous.
aq = aqueous; unless otherwise indicated the aqueous solution is taken as the hypothetical ideal state of unit molality.
gls = glass.
lq = liquid.
ppt = precipitate.

The values in these tables were taken from Circular of the National Bureau of Standards 500, "Selected Values of Chemical Thermodynamic Properties, issued February 1, 1952. **

VALUES OF CHEMICAL THERMODYNAMIC PROPERTIES OF HYDROCARBONS

The values in this table are from the American Petroleum Institute Research Project 44. The values are for the ideal gas state at 298.16°K and are expressed as calories per mole.

It is frequently possible to calculate values for compounds not listed since the following increments are known for an addition of a methylene group, CH_2, to the following types of compounds:

Normal alkyl cyclohexanes
Normal paraffins
Normal alkyl benzenes
Normal alkyl cyclopentanes
Normal monoolefins (1-alkenes)
Normal acetylenes (1-alkynes)

For each of the above types of compounds the increments per CH_2 group are:

ΔHf°	−4.926	cal/mole
ΔFf°	+2.048	"
Log$_{10}$ Kf	−1.5012	"
S°	+9.183	"

Compounds		ΔHf°	ΔFf°	Log$_{10}$ Kf	S°

HEAT OF COMBUSTION

For Organic Compounds

The heat of combustion is given in kilogram calories per gram molecular weight of the substance when combustion takes place at atmospheric pressure and 20° C. The final products of combustion are gaseous carbon dioxide, liquid water and nitrogen gas for C, H, N compounds. For method of computing heats of formation see statement following this table.

Selections from a compilation by Kharasch, Bureau of Standards Journal of Research **2**, 359 (1929).

Name	Formula	Physical state	Heat of combustion, kg. calories
Acetaldehyde	CH_3CHO	liquid	279.0
Acetamide	CH_3CONH_2	solid	282.6
Acetanilide	$CH_3CONHC_6H_5$	solid	1,010.4
Acetic acid	CH_3CO_2H	liquid	209.4
Acetic anhydride	$(CH_3CO)_2O$	liquid	431.9
Acetone	$(CH_3)_2CO$	liquid	426.8
Acetonitrile	CH_3CN	liquid	302.4
Acetophenone	$C_6H_5COCH_3$	solid	988.9
Acetylacetone	$CH_3COCH_2COCH_3$	liquid	615.9
Acetylene	$(CH)_2$	gas	312.0
Acrolein	$CH_2{:}CHCHO$	liquid	389.6
Acrylic acid	$CH_2{:}CHCO_2H$	liquid	327.5
Adipic acid	$(CH_2)_4(CO_2H)_2$	solid	669.0
Alanine	$CH_3CH(NH_2)CO_2H$	solid	387.7
Aldol, *see β-hydroxybutyr-aldehyde*			
Alizarin, *see Dihydroxyanthraquinone*			
Allyl alcohol	$CH_2{:}CHCH_2OH$	liquid	442.4
Allylene	$CH_3C{:}CH$	gas	465.1
p-Aminoazobenzene	$H_2NC_6H_4N_2C_6H_5$	solid	1,574.0
p-Aminophenol	$HOC_6H_4NH_2$	solid	760.0
Amygdalin	$C_{20}H_{27}O_{11}N$	solid	2,348.4
Amyl acetate	$C_4H_9CO_2C_2H_5$	liquid	1,042.5
Amyl alcohol (ferm.)	$(CH_3)_2CH_2CH_2CH_2OH$	liquid	793.7
Amylene	C_5H_{10}	liquid	803.4
Anethole	$C_{10}H_{12}O$	solid	1,324.4
Aniline	$C_6H_5NH_2$	liquid	811.7
p-Anisidine	$CH_3OC_6H_4NH_2$	solid	924.0
Anisole	$C_6H_5OCH_3$	liquid	905.1
Anthracene	$C_6H_4{:}(CH)_2{:}C_6H_4$	solid	1,700.4
Anthraquinone	$C_{14}H_8O_2$	solid	1,544.5
Arabinose	$C_5H_{10}O_5$	solid	559.9
Arabitol	$C_5H_{12}O_5$	solid	661.2
Arachidic acid	$C_{20}H_{40}O_2$	solid	3,025.9
Azelaic acid	$(CH_2)_7(CO_2H)_2$	solid	,141.7
Azobenzene	$(C_6H_5N)_2$	solid	545.9
Azoxybenzene	$(C_6H_5N)_2O$	solid	1,534.5
Behenic acid	$C_{22}H_{44}O_2$	solid	3,338.4
Benzalacetone	$C_6H_5CH{:}CHCOCH_3$	solid	1,257.4
Benzaldehyde	C_6H_5CHO	liquid	841.3
Benzamide	$C_6H_5CONH_2$	solid	847.6
Benzanilide	$C_6H_5CONHC_6H_5$	solid	1,575.5
Benzene	C_6H_6	liquid	782.3
Benzenediazonium nitrate	$C_6H_5N_2NO_3$	solid	782.6
Benzidine	$(C_6H_4NH_2)_2$	solid	1,560.9
Benzil	$(C_6H_5CO)_2$	solid	1,624.6
* Benzoic acid	$C_6H_5CO_2H$	solid	771.2
Benzoic anhydride	$(C_6H_5CO)_2O$	solid	1,555.1
Benzoin	$C_6H_5.CHOH.COC_6H_5$	solid	1,671.4
Benzonitrile	C_6H_5CN	liquid	865.5
Benzophenone	$(C_6H_5)_2CO$	solid	1,556.5

* Accepted value by Int. Union of Pure and Appld. Chem., Lyons, 1923

HEAT OF FORMATION

FOR ORGANIC COMPOUNDS

The heat of formation of a compound "A" is equal to the sum of the heats of formation of the products of combustion minus the heat of combustion (see preceding table) of the compound "A." The heat of formation of:

Free elements	0	kg-cal
CO_2 (gas)	94.38	"
$\frac{1}{2}H_2O$ (liquid from 1 H)	34.19	"
HF (dilute aqueous solution)	75.6	"
SO_2 (gas)	69.3	"
HBr (aqueous solution)	28.54	"
HCl (aqueous solution)	39.46	"
HNO_3 (aqueous solution)	49.80	"
H_2SO_4 (aqueous solution)	207.5	"

Example I

To calculate the heat of formation of methane (CH_4) where

Heat of combustion of methane = 210.8
Heat of formation of CO_2 = 94.38
Heat of formation of $\frac{1}{2}H_2O$ = 34.19

and where the combustion occurs according to the equation:

$$CH_4 + 2O_2 = CO_2 \text{ (gas)} + 2H_2O \text{ (liquid)}$$

Then the heat of formation of $CH_4 = 94.38 + 4(34.19) - 210.8 = +20.34$ kg-cal. per gram molecular weight.

Example II

To calculate the heat of formation of ethylene (C_2H_4) where

Heat of combustion of ethylene = 331.6

and the combustion occurs according to the equation:

$$C_2H_4 + 3O_2 = 2CO_2 + 2H_2O$$

The heat of formation of $C_2H_4 = 2(94.38) + 4(34.19) - 331.6 = -6.08$ kg-cal. per gram molecular weight.

Example III

To calculate the heat of formation of ethylamine ($C_2H_5NH_2$) where

Heat of combustion of ethylamine = 408.5

and the combustion occurs according to the equation:

$$C_2H_5NH_2 + 3.75O_2 = 2CO_2 + 3.5(H_2O) + 0.5N_2$$

The heat of formation of $C_2H_5NH_2 = 2(94.38) + 7(34.19) + O(N_2) - 408.5 = +19.59$ kg-cal. per gram molecular weight.

COMBUSTION CONSTANTS OF GASES

The flue products are based upon air with 21% oxygen and 79% nitrogen; flame temperatures are not corrected for dissociation; the high or gross heat value is one which would be obtained by burning in a Junker's calorimeter; it includes the heat of condensation of the water formed by combustion and assumes that all products of combustion are cooled to the initial temperature; the low or net heat value assumes that all of the products of combustion except water have been cooled to the initial temperature; the difference between the gross and the net is equal to the heat of vaporization of water at the initial temperature.

	Formula	Mol. wt.	Sp. gr. air 1	Lb. per cu. ft. dry	B.t.u. per lb.-mol. high (gross)	B.t.u. per lb.-mol. low (net)	B.t.u. per cu. ft. high (gross) 60° F. 30 in. satd. H_2O

THERMAL CONVERSION FACTORS FOR COMPETITIVE FUELS

Solid Fuels	**Btu (Gross)**
Bituminous coal and lignite	26,200,000/net T
Anthracite (Pennsylvania)	25,400,000/net T
Coal coke	26,000,000/net T
Petroleum coke	30,120,000/net T
Briquets and packaged fuels	23,000,000/net T
Wood including mill wastes	20,960,000/cord
Liquid Fuels	
Crude oil	5,800,000/bbl
Kerosene and range oils	5,691,000/bbl
Distillate fuel oils (Grades 1–4)	5,824,980/bbl
Residual fuel oils (Grades 5–6)	6,322,260/bbl
Coal tars	6,300,000/bbl
Gaseous Fuels	
Natural gas, wet	1,075/cu ft
Natural gas, dry	1,050/cu ft
Manufactured gas	550/cu ft
Liquefied petroleum gas	95,500/gal
Miscellaneous fuels	
Electrical energy	3,412/kw.-hr

HEATS OF COMBUSTION AND COMPOSITION OF MANUFACTURED AND NATURAL GASES

Products of combustion, theoretical flame temperatures, air required and B.T.U. of gas-air mixture are based upon air with 21 % oxygen and 79 % nitrogen; heat values are calculated from the table as given under "Combustion Constants of Gases;" flame temperatures are not corrected for dissociation; carburetted water gas, coal gas, coke-oven gases and oil gas contain a small amount of benzene and oxygen.

	Combustion Values								Composition								
	Theoretical flame temp. ° F.	B.T.U. per cu. ft., high (gross) 60° F., 30 in. Hg, satd. H_2O	B.T.U. per cu. ft., low (net) 60° F., 30 in. Hg, satd. H_2O	Cu. ft. air required per cu. ft. gas	Cu. ft. LIMITS OF INFLAMMABILITY

Reprinted from "Combustion Flame and Explosions of Gases," B. Lewis and G. von Elbe, authors, Academic Press (1951), publishers, by special permission.

The limits of inflammability given in the following tables were all determined at atmospheric pressure and room* temperature for upward propagation in a tube or bomb 2 inches or more in diameter. Values are on a percentage-by-volume basis.

LIMITS OF INFLAMMABILITY OF GASES AND VAPORS IN AIR

Compound	Empirical formula	Limits of inflammability	
		Lower	Upper
Paraffin hydrocarbons			
Methane	CH_4	5.00	15.00
Ethane	C_2H_6	3.00	12.50
Propane	C_3H_8	2.12	9.35
Butane	C_4H_{10}	1.86	8.41
Isobutane	C_4H_{10}	1.80	8.44
Pentane	C_5H_{12}	1.40	7.80
Isopentane	C_5H_{12}	1.32	.....
2,2-Dimethylpropane	C_5H_{12}	1.38	7.50
Hexane	C_6H_{14}	1.18	7.40
Heptane	C_7H_{16}	1.10	6.70
2,3-Dimethylpentane	C_7H_{16}	1.12	6.75
Octane	C_8H_{18}	0.95	.....
Nonane	C_9H_{20}	0.83	.....
Decane	$C_{10}H_{22}$	0.77	5.35
Olefins			
Ethylene	C_2H_4	2.75	28.60
Propylene	C_3H_6	2.00	11.10
Butene-1	C_4H_8	1.65	9.95
Butene-2	C_4H_8	1.75	9.70
Amylene	C_5H_{10}	1.42	8.70
Acetylenes			
Acetylene	C_2H_2	2.50	80.00
Aromatics			
Benzene	C_6H_6	1.40	7.10
Toluene	C_7H_8	1.27	6.75
o-Xylene	C_8H_{10}	1.00	6.00
Cyclic hydrocarbons			
Cyclopropane	C_3H_6	2.40	10.40
Cyclohexane	C_6H_{12}	1.26	7.75
Methylcyclohexane	C_7H_{14}	1.15	.....
Terpenes			
Turpentine	$C_{10}H_{16}$	0.80	.....
Alcohols			
Methyl alcohol	CH_4O	6.72	36.50
Ethyl alcohol	C_2H_6O	3.28	18.95
Allyl alcohol	C_3H_6O	2.50	18.00

---

* The upper limits of some vapors were determined at somewhat higher temperatures because of their low vapor pressures.

LIMITS OF INFLAMMABILITY OF GASES AND VAPORS IN AIR (Continued)

Compound	Empirical formula	Limits of inflammability	
		Lower	Upper
n-Propyl alcohol	C_3H_8O	2.15	13.50
Isopropyl alcohol	C_3H_8O	2.02	11.80

STEROID HORMONES

By Erwin Di Cyan

NATURE and FUNCTION: Secreted by the ductless glands and playing an immense role in the physical and metabolic development of man, the steroid hormones are characterized by the extremely minute quantities and indispensability of their need by the body. All of them have the cyclopentanophenanthrene nucleus, and although chemically very similar, a comparatively slight structural change is in many instances productive of physiologically dissimilar hormones, acting upon different physiologic systems, and having different *qualitative* as well as *quantitative* effects. Although originally isolated from natural sources (such as bulls' testes, mares' pregnancy urine, human pregnancy urine, etc), some steroid hormones have been synthetically prepared from cholesterol, bile acids or other steroid precursors; esters and other derivatives have been made from steroid hormones of synthetic, as well as natural sources. The hormones treated below, are those presently (1954) important in the treatment of endocrinologic dysfunctions or other diseases such as those of collagen nature in which they exert a characteristic ameliorative effect. They are administered on the basis of one or more of the following theories:

(a) To supplement the secretion of a specific hormone which progressively declines due to natural biologic aging of the organism; in the menopause as an example of such declining secretion, a female sex hormone is used for such supplementation.

(b) To make available to the body a specific hormone, the natural secretion of which is inhibited because of a functional congenital or developmental anomaly; in the case of the underdeveloped male secondary sex characteristics as an example of such an inhibited secretion, a male sex hormone is used.

(c) To cause a reversal of hormonal balance in the treatment of diseases peculiar to a sex; as examples, in the case of cancer of the female breast, a male sex hormone is administered, and in cancer of the prostate, a female sex hormone is used.

(d) To exert a therapeutic effect in certain disease states, in which the hormone has been found ameliorative, which disease states are not essentially endocrinologic in nature; for example cortisone and hydrocortisone in rheumatoid arthritis and osteoarthritis. With that development a changed concept has resulted, in that, the line of demarkation between diseases of endocrinologic and nonendocrinologic nature with respect to the use of hormones has been made fainter if not obliterated. Cortisone and hydrocortisone, steroid hormones in the fullest chemical sense, are used successfully in the treatment of diseases of the eye, skin and in other diseases only remotely related or apparently unrelated to the functioning of the ductless glands.

SOLUBILITY of HORMONES LISTED:

(a) *Water:* All hormones insoluble, except corticosterone, hydrocortisone and estrone slightly soluble.

(b) *Volatile Solvents:* All hormones soluble, except anhydrohydroxyprogesterone and desoxycorticosterone acetate slightly soluble; estradiol benzoate and estrone benzoate slightly soluble in ether, but soluble in other volatile solvents.

(c) *Vegetable Oils:* All hormones slightly soluble, except testosterone propionate soluble; since minimal quantities of hormones are required for effectiveness, this small order of solubility is often sufficient for usefulness.

SPECIFIC ROTATION of HORMONES LISTED: When determined in dioxane, 1% solution of the hormone employed, except estradiol benzoate and progesterone, in which a 2% solution in dioxane is employed, except when otherwise listed herein.

ASSAYS of HORMONES LISTED: All hormones are assayed biologically and chemical assays are often used conjunctively; in the case of synthetically produced hormones, chemical assays are commonly used solely.

USAGE of HORMONES LISTED:

(a) *Androgenic* (Male), originally isolated from bulls' testes, now made synthetically. *In the male,* to supplement the supply of naturally secreted testosterone, the production of which lessens with advancing age, or the normal elaboration of which in the male is inhibited at puberty, due to an endocrinologic disorder. Used to stimulate development of male secondary sex characteristics, in treatment of eunuchoidism, undescended testes and as supportive treatment of symptoms of the male climateric. *In the female,* to suppress excessive menstrual bleeding, and in cancer of the breast. *Dosage:* 5 to 25 mgms. *Testosterone* is used intramuscularly as oil solution or as aqueous suspension of crystals, topically as ointment, sublingually as tablets, or by implantation of crystals under the skin. *Testosterone propionate* (oil solution) intramuscularly, has an effect more protracted than testosterone. *Methyl testosterone* (tablets) is orally active, and used orally or by inunction. *Androsterone, Dehydroandrosterone* or *Dihydroandrosterone* are now only rarely used if at all, since testosterone and its derivatives, being much more active, have replaced them. (See Charts.)

(b) *Cortical,* originally isolated from the cortex of the adrenal glands, now made synthetically. These hormones stimulate adrenal function. *Corticosterone* is used in shock, intramuscularly as oil or aqueous solution. *Desoxycorticosterone* most generally used as *Desoxycorticosterone acetate* (oil solution or by implantation of crystals) finds its chief use in Addison's disease. *Cortisone and Hydrocortisone* are used in an ever increasing number of entities, including rheumatoid arthritis, allergic manifestations, asthma, psoriasis and other skin diseases. Cortisone is used orally in doses of 50 mg. to 200 mg. daily, and the acetate parenterally or ophthalmically. Hydrocortisone is used orally in doses of 50 mg. to 200 mg. daily and the acetate intraarticularly and topically.

(c) *Estrogenic* (Female), isolated from pregnancy urines and most recently made synthetically. *In the female,* to supplement the supply of naturally secreted estrogens the production of which lessens with advancing age, or the normal elaboration of which in the female is inhibited at puberty due to an endocrinologic disorder. Used to stimulate the development of female secondary sex characteristics, but find their greatest use in the treatment of the symptoms associated with the menopause. The latter are extremely varied, and manifest themselves as symptoms of cardiac, vasomotor or neurologic nature. *In the male,* to inhibit or suppress the development of cancer of the prostate. *Dosage:* 10,000 to 50,000 IU. *Estradiol* is used intramuscularly as oil solution, topically as ointment, orally as tablets, vaginally as suppositories, or by implantation of crystals under the skin. *Estradiol benzoate* and *Estrone benzoate* (oil solution) have an effect more protracted than estradiol or estrone. *Estrone* is used intramuscularly (oil solution or aqueous suspension of crystals), and may be used orally, although it is not as active orally as estradiol. *Estriol* and *Ethinyl estradiol* are orally active and used orally. Diethylstilbestrol, dienestrol and hexestrol are used for the same purposes as the estrogenic hormones. They are chemicals having a hormonelike action and although they resemble the steroid hormones structurally *in some* part of their own structures, they are not considered here because firstly, they are not steroid hormones or secondly, they do not occur naturally.

(d) *Progestational* (Female), originally isolated from the corpus luteum, now made synthetically. *In the female,* to supplement the supply of naturally secreted progesterone. Used in the treatment of excessive menstrual bleeding (either by itself or in combination with estrogens), habitual or threatened abortion, and in premenstrual tension or dysmenorrhea. *Dosage:* 5 to 25 mgms. *Progesterone* is used intramuscularly as oil solution. *Anhydrohydroxyprogesterone* is orally active and used orally.

STEROID HORMONES—ANDROGENIC

NAMES: Common or official name; Synonyms; Chemical designations	ANDROSTERONE; cis-androsterone; 3-hydroxy-androstan-17-one; androstane-3-cis-ol-17-one	D*E*HYDROANDROSTERONE; dehydroisoandrosterone; transdehydroandrosterone; Δ^5-androstene-3-trans-ol-17-one; Δ^5-androstene-3-(β)-ol-17-one	D*I*HYDROANDROSTERONE; androstandiol; 3-cis-17-transandrostandiol
FORMULAE: Structural and empirical	 $C_{19}H_{30}O_2$	 $C_{19}H_{28}O_2$	 $C_{19}H_{32}O_2$

STEROID HORMONES—CORTICAL

NAMES: Common or official name, Synonyms; Chemical designations	CORTICOSTERONE; 11–21-dihydroxyprogesterone; 17-(β)-[1-keto-2-hydroxyethyl]-Δ⁴-androstene-3-one-11-(β)-ol	DESOXYCORTICOSTERONE; deoxycorticosterone; deoxycostone; 11-desoxycorticosterone; 21-oxyprogesterone; 21-hydroxyprogesterone; 17-(α)-[1-keto-2-hydroxyethyl]-Δ⁴-androstene-3-one; Δ⁴-21-hydroxypregnene-3,20-dione	DESOXYCORTICOSTERONE ACETATE; deoxycostone acetate; 11-desoxycorticosterone acetate; (see also desoxycorticosterone)
FORMULAE: Structural and empirical	 $C_{21}H_{30}O_4$	 $C_{21}H_{30}O_3$	 $C_{23}H_{32}O_4$
Molecular weights	346.36	330.2	372.49
Melting points (°C)	180–182	140–142	154–160
Specific rotation	$(\alpha)\ \frac{25}{D} + 222$ (alcohol)	$(\alpha)\ \frac{22}{D} + 176 - +178$ (alcohol)	$(\alpha)\ \frac{20}{D} + 168 - +178$ (dioxane)

STEROID HORMONES—CORTICAL (Continued)

NAMES: Common or official name;	CORTISONE: 17-hydroxy-11-dehydrocorticosterone; 17 (α)-[1-keto-2-hydroxyethyl] Δ^4-androstene-3,11-dione-17-(β)-ol;	HYDROCORTISONE: 17-hydroxycorticosterone;
Synonyms;	Wintersteiner's Compound "F";	17-[1-keto-2-hydroxyethyl] Δ^4-androstene-11,17 (α)-diol-3-one;
Chemical designations	Kendall's "Compound E"	Kendall's "Compound F"
FORMULAE: Structural and empirical	 $C_{21}H_2O_5$	 $C_{21}H_{30}O_5$
Molecular weights	360.53	362.45
Melting points (°C)	208–217(?)	217–220°C
Specific rotation	$(\alpha)\ \frac{25}{D} + 195 - +209$ (alcohol)	$(\alpha)\ \frac{22}{D} + 167$ (abs. alcohol)

STEROID HORMONES—ESTROGENIC

NAMES: Common or official name; Synonyms; Chemical designations	EQUILENIN; 3-hydroxy-17-keto-$\Delta^{1,3,5-10,6,8}$ estrapentaene; $\Delta^{1,3,5-10,6,8}$-estrapentaene-3-ol-17-one	EQUILIN; 3-hydroxy-17-keto-$\Delta^{1,3,5-10,7}$ estratetraene; $\Delta^{1,3,5-10,7}$-estratetraene-3-ol-17-one	ESTRADIOL; α-estradiol; dihydrofolliculin; dihydrotheelin; dihydroxyestrin; 3,17-dihydroxy-$\Delta^{1,3,5-10}$-estratriene; $\Delta^{1,3,5-10}$-estratriene-3-17-trans-diol
FORMULAE: Structural and empirical	 $C_{18}H_{18}O_2$	 $C_{18}H_{20}O_2$	 $C_{18}H_{24}O_2$
Molecular weights	264.28	266.3	272.37
Melting points (°C)	258–259	236–240	173–179
Specific rotation	$(\alpha)\frac{25}{D} + 89$ (dioxane)	$(\alpha)\frac{25}{D} + 325$ (alcohol)	$(\alpha)\frac{25}{D} + 76 - +83$ (dioxane)

STEROID HORMONES—ESTROGENIC (Continued)

NAMES: Common or official name; Synonyms; Chemical designations	ESTRADIOL BENZOATE; 3-benzoxy-$\Delta^{1,3,5}$-estratriene-17-ol; (see also estradiol)	ESTRIOL; theelol; trihydroxyestrin; 3,16,17-trihydroxy-$\Delta^{1,3,5}$-estratriene; $\Delta^{1,3,5-10}$-estratriene-3-16-cis-17-trans-diol	ESTRONE; folliculine; ketohydroxyestrin; theelin; 3-hydroxy-17-keto-$\Delta^{1,3,5-10}$ estratriene; $\Delta^{1,3,5-10}$-estratriene-3-ol-17-one
FORMULAE: Structural and empirical	 $C_{25}H_{28}O_3$	 $C_{18}H_{24}O_3$	 $C_{18}H_{22}O_2$
Molecular weights	376.47	288.37	270.36
Melting points (°C)	191–196	282	258–262
Specific rotation	$(\alpha)\frac{25}{D}$ + 58 – +63 (dioxane)	$(\alpha)\frac{25}{D}$ + 53 – +63 (dioxane)	$(\alpha)\frac{25}{D}$ + 158 – +168 (dioxane)

STEROID HORMONES—ESTROGENIC (Continued)

NAMES: Common or official name; Synonyms; Chemical designations	ESTRONE BENZOATE; 3-benzoxy-$\Delta^{1,3,5}$-estratriene-17-one; (see also estrone)	ETHINYL ESTRADIOL; 17-ethinyl estradiol; 17-ethenyl estradiol; 17-ethinyl-3,17-dihydroxy-$\Delta^{1,3,5-10}$-estratriene; 17-(β)-ethinyl-$\Delta^{1,3,5-10}$-estratriene-3,17-(α)-diol
FORMULAE: Structural and empirical	 $C_{25}H_{26}O_3$	 $C_{20}H_{24}O_2$
Molecular weights	374.47	296.4
Melting points (°C)	220	141–146
Specific rotation	$(\alpha)\frac{25}{D} + 120$ (dioxane)	$(\alpha)\frac{25}{D} + 1 - + 10$ (dioxane)

STEROID HORMONES—PROGESTATIONAL

NAMES: Common or official name; Synonyms; Chemical designations	ANHYDROHYDROXYPROGESTERONE; ethinyl testosterone; ethisterone; pregneninonol; pregneninolone; 17-(β)-ethinyl-Δ⁴-androstene-3-one-17-(α)-ol; Δ⁴-17-ethinyl-androsten-17-ol-3-one	PROGESTERONE; progestin; progestone; 17-(β) or (α)-[1-ketoethyl]-Δ⁴-androstene-3-one; pregnendione; Δ⁴-pregnen-3-20-dione
FORMULAE: Structural and empirical	 $C_{21}H_{2}.O_{2}$	 $C_{21}H_{30}O_{2}$
Molecular weights	312.43	314.45
Melting points (°C)	266–273	(β) isomer 121; (α) isomer 127–131
Specific rotation	$(\alpha)\ \frac{25}{D} + 18 - +28$ (dioxane)	$(\alpha)\ \frac{25}{D} + 172 - +182$ (dioxane)

STEROID HORMONES—PROGESTATIONAL (Continued)

NAMES: Common or official name; Synonyms; Chemical designations	PREGNENOLONE: Δ^5 pregnenolone; Δ^5 pregnene-3β-ol-20-one; 17(β)[1-ketoethyl]-Δ^5-androstene-3(β)-ol	ACETOXYPREGNENOLONE; 21-acetoxypregnenolone; Δ^5 pregnene-3(β)21-diol-20-one-21-monoacetate
FORMULAE: Structural and empirical	 $C_{21}H_{32}O_2$	 $C_{22}H_{35}O_4$
Molecular weights	308.43	366.45
Melting points (°C)	185–190	178–182
Specific rotation	$(\alpha)\frac{20}{D} + 28 - +30$ (alcohol)	$(\alpha)\frac{20}{D} + 37 - +43$ (dioxane)

CHARACTERISTICS AND FUNCTIONS OF THE VITAMINS

Compiled by H. J. Prebluda

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin A............ (animal sources) **Carotenes** (plant sources) (provitamin A) Fat soluble A Anti-Xerophthalmic vitamin	*Vitamin A_1* ($C_{20}H_{29}OH$) *Vitamin A_2* ($C_{22}H_{31}OH$) Pale, viscous, fat-soluble, heat and oxygen labile liquids found in fish liver oils. *Carotenes*—orange red pigments—Kryptoxanthin, alpha and beta carotene—found in plants and are precursors of vitamin A being changed to this vitamin in the human body. Have same fat soluble and labile properties of vitamin A especially to oxidation. One molecule of beta carotene has physiological potency of two molecules of vitamin A. Alpha carotene has 50% activity of beta carotene.	Vitamin A is essential for growth, normal vision and for maintenance of normal condition of epithelial tissue. Prevention of nyctalopia (night blindness) and regeneration of retinal visual purple bleached by light. Dried out epithelial tissue deficient in vitamin A seems to have less resistance to invasion by bacteria. Requirements are greatest during periods of rapid growth, pregnancy, lactation or illness.	Dryness and keratinization of the eye conjuctiva (xerophthalmia) hyperkeratosis of mucous membrane and dermal structures. Dryness of skin. Retardation of growth.	Leafy portions of green plants Salt water fish liver oils—A_1 Fresh water fish liver oils—A_2 Eggs Butter Cream Provitamin A found in pigmented plants such as carrots, sweet potatoes, yellow corn, etc. Apricots
Vitamin B_1............ Thiamin chloride Thiamin hydrochloride Aneurin Anti-beri-beri vitamin Anti-neuritic vitamin	A white crystalline powder having the formula $C_{12}H_{17}ON_4SCl.HCl$, soluble in alcohol and water. Heat and alkali labile stable to aeration.	Necessary in formation of enzymes participating in carbohydrate metabolism. Essential for maintenance of good appetite, normal	Retarded growth, loss of appetite, leg weakness, convulsive seizures associated with spastic paralysis and focal accumulation	Liver Yeast Milk Eggs Fruits Legumes

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
	Molecular structure includes a pyridine and thiazole group which is broken down by sulfite treatment.	digestion and gastric tonicity. Necessary for lactation and reproduction. Lack of vitamin B_1 has been responsible for various forms of nerve disturbances and suboptimal growth of infants and children.	of pyruvic acid in central nervous systems with accompanying polyneuritis. Emotional instability and enlargement of heart.	Leafy vegetables Lean meat Embryos of cereal grains
Vitamin B_2............ (Member of the vitamin B Complex) Riboflavin Vitamin G Lactoflavin (from milk) Ovoflavin (from eggs) Hepatoflavin (from liver)	An orange yellow pigment ($C_{17}H_{20}N_4O_6$) containing an iso-alloxazine nucleus combined with *d*-ribose. Solutions of riboflavin exhibit a strong greenish-yellow fluorescence in ultra violet which is the basis for fluorometric assay of this vitamin. Riboflavin is water soluble, heat stable in acid or neutral solutions and readily destroyed in an alkaline medium. Visible light (blue and violet regions) destroys this vitamin.	Necessary for growth and respiration of all tissues and cells. Has been demonstrated to increase vitality and postpone senility in succeeding generations of experimental animals. Necessary for growth of domestic animals. Necessary for egg hatchability.	A reddening and slimy denuded appearance of the lips, waxy accumulations at the nasolabial folds of the skin, ocular lesions accompanied by burning sensation and light sensitivity, roughening of skin around the mouth and across tip of nose. Curled toe paralysis in chicks.	Milk Liver Eggs Wheat germ Fermentation by-products Meat Leafy vegetables
Niacin................. Nicotinic acid Pellagra preventive P-P factor	3-pyridine carboxylic acid which is somewhat soluble in hot water. The amide derivative is	A component of co-enzymes important in glycolysis and cellular respiration.	Pellagra with burning soreness of mouth, loss of appetite, loss of weight, and diges-	Liver Kidney Lean meat Peanuts

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Anti-black tongue factor (Member of vitamin B complex)	more soluble and called niacinamide. Relatively stable to heat.	Essential for health and growth. Necessary for maintaining normal function of skin and gastro-intestinal tract.	tive nervous disturbances.	Yeast Eggs Fish Bran Green leafy vegetables
Vitamin B$_6$............ (Member of vitamin B complex) Pyridoxin Adermin Rat acrodynia factor	Derivative of pyridine. Commercially available as hydrochloride—white powder ($C_8H_{11}NO_3.HCl$) which is stable in solution in absence of strong light. Acid solutions stable to autoclaving below pH5.	Significance in human nutrition not fully established. Has been found useful in alleviating certain nervous and muscular disorders. Probably plays role in unsaturated fatty acid utilization and liver metabolism. Important in chick, hog, and dog nutrition.	Microcytic hypochromic anemia in dogs, lack of coordination of gait of pigs. One of the vitamins lacking in individuals having multiple deficiencies in pellagra.	Liver Yeast Crude cane molasses Cereals Legumes Milk
Pantothenic Acid...... Pantothen Filtrate factor Chick anti-dermatitis factor Factor II (Member of vitamin B complex)	Beta-alanine derivative of a substituted butyryl lactone. A white solid not readily soluble in water. Commercially available as calcium salt $Ca(C_9H_{16}O_5N)_2$ which is water soluble. Stable to autoclaving, light oxidizing and reducing agents. Unstable to alkali.	Significance in human nutrition not established. Essential for certain bacteria, rats, chickens, and dogs, as well as humans. Necessary for maintaining normal adrenal activity. Thought to be one of several substances playing a role in preventing grey hair. Essential for growth and reproduction of chicks.	Dermatitis in chicks. Retarded growth and greying of hair in rats. Deficiency usually occurs along with pellagra.	Yeast Liver Kidney Eggs Cane Molasses Milk Wheat germ

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Choline (Member of vitamin B complex)	Hydroxyethyl trimethyl ammonium hydroxide—a colorless viscous liquid which has strong basic properties. Basic constituent of lecithin and the chloride is available commercially. The latter is a colorless crystalline hygroscopic solid—very soluble in water. Salty, bitter taste.	Essential in fat metabolism to mobilize fatty acids, supplies "labile" methyl groups.	Impairment of liver and renal functions. "Slipped tendon" of fowl.	Liver Egg yolk Brain Kidney Heart Sweet breads Yeast Cereal germs Legumes Green leafy vegetables Potatoes Milk
Vitamin C Ascorbic acid Anti-scorbutic vitamins Cevitamic acid	A hexuronic acid. A white crystalline solid soluble in water with sour acid taste. Insoluble in oils. Destroyed by exposure to air, light, and alkali. Deterioration accelerated by metals such as iron and copper. Strong reducing agent. Cannot be stored in the body.	Prevents and cures scurvy. Necessary for formation and maintenance of intercellular tooth and bone structure. Prevents capillary fragility. Increases resistance to bacterial toxins and infections. Infection increases vitamin C requirement of body.	Scurvy. Dental caries. Gum infections. Slow healing of wounds. Defective formation of bones and teeth.	Citrus fruits Alfalfa Cabbage Green and red peppers Raw turnip Tomato Pineapple
Vitamin D Anti-rachitic vitamin	At least ten active vitamin D sterols are known. The two important sterols are vitamin D_2 (activated ergosterol, calciferol) derived mainly from vegetable sources and vitamin	Regulation of calcification of bone structure. Regulates absorption and utilization of calcium and phosphorus.	Rickets. Poor bone development. Tooth decay. Osteomalacia.	Fish liver oils Mackerel Herring Sardines Egg yolk Tuna Liver

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
	D_3 (activated 7-dehydrocholesterol) derived mainly from animal sources. Vitamin D is fat soluble, heat stable and not readily destroyed by oxidation. Can be produced in many foodstuffs by irradiation or exposure to sunlight. Light energy activates sterols present to active vitamin D. In similar fashion sterols beneath skin are activated to form vitamin D upon exposure to ultra violet or sunlight. Activated ergosterol dissolved in vegetable oils = viosterol.			
Vitamin E .... Alpha tocopherol Anti-sterility vitamin	Has chromane structure ($C_{20}H_{50}O_2$). Thick viscous oil-soluble in fat solvents. Heat stable and resistant to mild oxidation. Ferric salts and rancid fats destroy physiological activity. Obtained from natural sources in unsaponifiable fraction.	Has anti-oxidant properties. Has not been demonstrated to be effective in humans but has been shown to prevent sterility in male and female rats. Important in muscular and nervous systems.	No definite deficiency symptoms in humans. Has been used with success in habitual and threatened abortion as well as certain neuromuscular disorders.	Wheat germ oil Corn oil Lettuce Spinach Egg yolk Meat Legume Seeds

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin K............ Anti-hemorrhagic factor Coagulation vitamin	Natural product is naphthoquinone compound—oily liquid and insoluble in H_2O. Fat-soluble, stable to heat and reducing agents. Labile to alcoholic alkali, oxidizing agents, strong acids, and $AlCl_3$. Occurs in nature as a phytyl derivative (vitamin K_1) in green leaves. The difarnesyl derivative (vitamin K_2) is formed by putrefaction. A commercial synthetic 2, methyl 1,4 naphthoquinone has vitamin K activity and is called Menadione.	Aids in prevention of hemorrhage in newborn. Essential in promoting normal prothrombin content and clotting of blood.	Obstructive jaundice. Hemorrhagic tendency. Poor healing of wounds after postoperative conditions.	Alfalfa concentrate Spinach Cabbage Cauliflower Kale Carrot greens Tomatoes

VITAMINS (Continued)

Vitamin Unit Table

Vitamin A	1 International Unit = 1 USP Unit Activity of 0.6 micrograms* of beta-carotene
Vitamin B_1	1 International Unit = 1 USP Unit Activity of 3.0 micrograms of crystalline thiamin chloride
Riboflavin	Quantities expressed in micrograms or milligrams
Niacin Niacin amide	Quantities expressed in micrograms or milligrams
Pantothenic acid	Quantities expressed in micrograms or milligrams
Choline	Quantities expressed in milligrams
Pyridoxine	Quantities expressed in micrograms or milligrams
Vitamin C	Expressed in milligrams 1 International Unit = 1 USP Unit and is equal to activity of 0.05 milligrams of synthetic ascorbic acid.
Vitamin D (For humans and four-footed animals)	1 International Unit = 1 USP Unit Potency of 0.025 micrograms of pure Vitamin D_2 (calciferol) made by irradiation of ergosterol.
Vitamin E	Measured in micrograms or milligrams One I.U is the alpha tocopherol activity of 0.1 gm of the International standard solution containing 1 mg. of pure synthetic alpha tocopherol acetate.

* Note.—One microgram = 0.000001 grams

Abbreviations

A = Vitamin A
B = Vitamin B_1
C = Vitamin C
D = Vitamin D
E = Vitamin E
K = Vitamin K
N = Nicotinic Acid or Niacin
R = Riboflavin

Reaction indicates the type and degree of reaction of the food in the body. The relative acidity or basicity is indicated by the designation h, high; m, medium; and l, low.

RECOMMENDED DAILY DIETARY ALLOWANCES[1] (Continued)

[1] Food and Nutrition Board, National Research Council, Revised 1953.

In planning practical dietaries, recommended allowances can be attained with a variety of common foods which will also provide other nutrient requirements less well known; the allowance levels are considered to cover individual variations among normal persons as they live in the United States subjected to ordinary environmental stresses.

[2] These calorie recommendations apply to the degree of activity for the average man and woman. For the urban "white-collar" worker they are probably excessive. In any case, the calorie allowance must be adjusted to the actual needs of the individual as required to achieve and maintain his desirable weight.

[3] The recommendations for infants pertain to nutrients derived primarily from cow's milk. If the milk from which the protein is derived is human milk or has been treated to render it more digestible, the allowance may be in the range of 2–3 gms. per kg. There should be no question that human milk is a desirable source of nutrients for infants even though it may not provide the levels recommended for certain nutrients.

[4] During the first month of life, desirable allowances for many nutrients are dependent upon maturation of excretory and endocrine functions. Therefore no specific recommendations are given.

COMPOSITION AND VALUE OF FOODS

Compiled mainly from the publications of the U. S. Department of Agriculture.

The proportions of **protein, fat, carbohydrate** and **mineral matter** are given as percent by weight of the food named. The fuel value is stated in kilogram calories per 100 grams.

The standard daily requirement for an average adult has been accepted as 3000 calories; 75 g of protein, 0.69 g of calcium, 1.32 g of phosphorus, 0.015 g of iron.

The relative value of the food as a source of **vitamins** is shown by letters indicating the vitamins present with subscripts showing the relative abundance. Symbol **N** is used to indicate nicotinic acid and **R,** riboflavin. The best sources are indicated as rich in the particular vitamin by the subscript $_{r}$. Other classifications are shown by the subscripts $_{e}$, $_{g}$ and $_{f}$ for excellent, good and fair respectively.

DECOMPOSITION OF ANHYDROUS METALLIC SULFATES

Metallic sulphate.	Temp. at beginning of decomposition, °C.	Temp. of energetic decomposition, °C.	Products of decomposition.	Color of product.
$FeSO_4$	167	480	Fe_2O_3, $2SO_4$	Yellow brown
Fe_2O_3, $2SO_3$	492	560	Fe_2O_3	Red
$Bi_2(SO_4)_3$	570	639	$5Bi_2O_3$, $4(SO_3)_3$.	White
$Al_2(SO_4)_3$	590	639	Al_2O_3	White
$PbSO_4$	637	705	$6PbO$, $5SO_3$	White
$CuSO_4$	653	670	$2CuO$, SO_3.	Ornage
$MnSO_4$	699	790	Mn_3O_4	Dark red to black
$ZnSO_4$	702	720	$3ZnO$, $2SO_3$	White
$2CuO$, SO_3	702	736	CuO	Black
$NiSO_4$	703	764	NiO	Brownish green
$CoSO_4$	720	770	CoO	Brown to black
$3ZnO$, $2SO_3$	755	767	ZnO	White
$CdSO_4$	827	846	$5CdO$, SO_3	White
$5Bi_2O_3$, $4(SO_3)_3$	870	890	Bi_2O_3(?)	Yellow
$5CdO$, SO_3	878	890	CdO	Brown
$MgSO_4$	890	972	MgO	White
Ag_2SO_4	917	925	Ag	Silver white
$6PbO$, $5SO_3$	952	962	$2PbO$, SO_3(?).	White to yellow
$CaSO_4$	1200	....	CaO	White
$BaSO_4$	1510	....	BaO	White

SPECIFIC GRAVITY OF AQUEOUS SOLUTIONS

The following collections of tables gives the specific gravity, grams per liter, pounds per cubic foot, and pounds per gallon for a large number of substances in aqueous solution. The three latter quantities have been computed from the per cent of the substance in solution and the specific gravity, assuming the density of water at 4° C. as unity. The U. S. gallon, cubic foot, and pound avoirdupois equivalents were used. The degree Baumé corresponding to the specific gravity is given according to the relation,

$$\text{Bé.} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

The per cent by weight is indicated in every case.

The substances are arranged in alphabetical order. The specific gravity of alcohol solutions will be found in a separate group. Another table gives, with less detail, the specific gravity of solutions of many other substances.

Tables indicated by the symbol * have been computed on the basis of values for the specific gravity found in the International Critical Tables.

AQUA AMMONIA

Authority — W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = \frac{140}{\text{Sp. Gr.}} - 130.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

The coefficient of expansion for Ammonia Solutions varying with the temperature, correction must be applied according to the following table:

Degrees Baumé	Corrections to be added for each degree below 60° F.		Corrections to be subtracted for each degree above 60° F.			
	40° F.	50° F.	70° F.	80° F.	90° F.	100° F.

HYDROCHLORIC ACID

Authority—W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

10° – 15° Bé.—1/40° Bé. or .0002 Sp. Gr. for 1° F.
15° – 22° Bé.—1/30° Bé. or .0003 " " " 1° F.
22° – 25° Bé.—1/28° Bé. or .00035 " " " 1° F.

NITRIC ACID

Authority — W. C. Ferguson

This table has been approved and adopted as a Standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

At 10°–20° Bé. — 1/30° Bé. or .00029 Sp. Gr. = 1° F.
20°–30° Bé. — 1/23° Bé. or .00044 " " = 1° F.
30°–40° Bé. — 1/20° Bé. or .00060 " " = 1° F.
40°–48.5° Bé. — 1/17° Bé. or .00084 " " = 1° F.

TABLES OF THE MANUFACTURING CHEMISTS' ASSOCIATION

SULFURIC ACID

Authorities—W. C. FERGUSON; H. P. TALBOT

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should always be printed on the scale.

66° Baumé = Sp. Gr. 1.8354.

1 cu. ft. water at 60° F. weighs 62.37 lbs. av.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

H_2SO_4 = 100 per cent.

	H_2SO_4	O. V.	60°
O. V.	93.19	100.00	119.98
60°	77.67	83.35	100.00
50°	62.18	66.72	80.06

Acids stronger than 66° Bé. should have their percentage compositions determined by chemical analysis.

Bé.*	Sp. gr.	Tw.*	Per cent H_2SO_4	Weight of 1 cu. ft. in lbs. av.	Per cent O. V.	Pounds O. V. in 1 cu. ft.	* Freezing (melting) point.

ETHYL ALCOHOL

SPECIFIC GRAVITY OF MIXTURES OF ETHYL ALCOHOL AND WATER BY VOLUME AND BY WEIGHT

Giving the specific gravity of 15.56° C. referred to water at the same temperature. To reduce to specific gravity referred to water at 4° C. multiply by 0.99908.

(U. S. Department of Agriculture.)

Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.	Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.

METHYL ALCOHOL

Specific Gravity of Mixtures of Methyl Alcohol and Water by Volume and by Weight

Giving the specific gravity at 15°C referred to water at 4°C.

(Calculated from values by Doroshevski and Rozhdestvenski, Dittmar and Fawsitt.)

Per cent alcohol by weight	Per cent alcohol by volume	Specific gravity	Per cent alcohol by weight	Per cent alcohol by volume	Specific gravity

METHYL ALCOHOL

Specific Gravity of Mixtures of Methyl Alcohol and Water by Volume and by Weight

Giving the specific gravity at 15.6° C. referred to water at the same temperature. To reduce to specific gravity of water at 4°C. multiply by 0.99908.

(Techn. Hogskolan, Stockholm.)

Specific gravity	Per cent alcohol by wt.	Per cent alcohol by vol.	Specific gravity	Per cent alcohol by wt.	Per cent alcohol by vol.	Specific gravity	Per cent alcohol by wt.	Per cent alcohol by vol.

Calculation of the percentage of ethyl and methyl alcohols in a mixture with water, assuming a distillate to have a sp. gr. of 0.97917 $\frac{15.56^\circ}{15.56^\circ}$ and a refraction of 30.0 at 20° on the immersion refractometer. — From the tables of sp. gr. for these alcohols the density is found to correspond to 13.70% and 12.83% by weight of ethyl and methyl alcohol respectively; from the table above, the refractometer readings corresponding to 13.70% ethyl and methyl alcohol are 38.16 and 22.42 respectively. Then $(38.16 - 30.0) / (38.16 - 22.42) \times 100 = 51.8\%$, or 51.8% of the alcohol in the distillate is methyl alcohol.

$(12.83 \times 0.518) + 13.70 \times (1 - 0.518) = 13.25$ which is the % by weight of the mixed alcohols in the distillate, of which 13.25×0.518 o 6.86 % is methyl alcohol and $13.25 \times (1 - 0.518)$ or 6.39 % is ethyl alcoho

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.

In the case of substances with voids such as paper or leather the bulk density is indicated rather than the density of the solid portion.

(Selected principally from the Smithsonian Tables.)

Substance	Grams per cu. cm	Pounds per cu. ft.
Agate	2.5–2.7	156–168
Alabaster, carbonate	2.69–2.78	168–173
sulfate	2.26–2.32	141–145
Albite	2.62–2.65	163–165
Amber	1.06–1.11	66–69
Amphiboles	2.9–3.2	180–200
Anorthite	2.74–2.76	171–172
Asbestos	2.0–2.8	125–175
Asbestos slate	1.8	112
Asphalt	1.1–1.5	69–94
Basalt	2.4–3.1	150–190
Beeswax	0.96–0.97	60–61

DENSITY OF WATER

The temperature of maximum density for pure water, **fre** from air = **3.98**°C.

The density at this temperature = **0.999973** g/cm^3.

The density of water at 3.98° C is 1.000000 g/ml.

(International Bureau of Weights and Measures, 1910.)

WEIGHT OF 1 GALLON OF WATER

The weights in air are for dry air at the same temperature as the water up to 40°C. and at a (corrected) barometric pressure of 760 mm and against brass weights of 8.4 density at 0°C. Above 40°C. the temperature of the air is assumed to be 20°C., i. e., the water is allowed to cool to 20°C. before the weighings are made. The volumetric computations are based on the relation that 1 liter = 1.000027 cubic decimeters and 1 cubic decimeter = 61.023378 cubic inches.

Temperature °C.	Weight in vacuo		Weight in air

TEMPERATURE CORRECTION FOR VOLUMETRIC SOLUTIONS

This table gives the correction to various observed volumes of water, measured at the designated temperatures to give the volume at the standard temperature, 20°C. Conversely, by subtracting the corrections from the volume desired at 20°C., the volume that must be measured out at the designated temperatures in order to give the desired volume at 20°C., will be obtained. It is assumed that the volumes are measured in glass apparatus having a coefficient of cubical expansion of 0.000025 per degree centigrade. The table is applicable to dilute aqueous solutions having the same coefficient of expansion as water.

Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.						
	2,000	1,000	500	400	300	250	150
	Correction in milliliters to give volume of water at 20°C.						
15	+1.54	+0.77	+0.38	+0.31	+0.23	+0.19	+0.12
16	+1.28	+ .64	+ .32	+ .26	+ .19	+ .16	+ .10
17	+ .99	+ .50	+ .25	+ .20	+ .15	+ .12	+ .07
18	+ .68	+ .34	+ .17	+ .14	+ .10	+ .08	+ .05
19	+ .35	+ .18	+ .09	+ .07	+ .05	+ .04	+ .03
21	− .37	− .18	− .09	− .07	− .06	− .05	− .03
22	− .77	− .38	− .19	− .15	− .12	− .10	− .06
23	−1.18	− .59	− .30	− .24	− .18	− .15	− .09
24	−1.61	− .81	− .40	− .32	− .24	− .20	− .12
25	−2.07	−1.03	− .52	− .41	− .31	− .26	− .15
26	−2.54	−1.27	− .64	− .51	− .38	− .32	− .19
27	−3.03	−1.52	− .76	− .61	− .46	− .38	− .23
28	−3.55	−1.77	− .89	− .71	− .53	− .44	− .27
29	−4.08	−2.04	−1.02	− .82	− .61	− .51	− .31
30	−4.62	−2.31	−1.16	− .92	− .69	− .58	− .35

In using the above table to correct the volume of certain standard solutions to 20°C. more accurate results will be obtained if the numerical values of the corrections are increased by the percentages given below:

Solution	Normality		
	N	N/2	N/10
HNO_3	50	25	6
H_2SO_4	45	25	5
NaOH	40	25	5
KOH	40	20	4

TEMPERATURE CORRECTION FOR GLASS VOLUMETRIC APPARATUS

This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20°C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20°C. the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.000025 per degree centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from 0.000023 to 0.000028.

Temperature in degrees C.	2,000 ml	1,000 ml	500 ml	400 ml	300 ml	250 ml

HYDROMETERS AND DENSITY UNITS

Alcoholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent.

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barktrometer or *Barkometer.* — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

Sp. gr. = $\frac{m}{m - d}$ where m = 145 (in the United States)
m = 144 (old scale used in Holland)
m = 146.78 (New scale or Gerlach scale)
d = Baumé reading

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or *Balling Saccharometer* shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer.—For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

RELATIVE DENSITY AND VOLUME OF WATER

The mass of one cubic centimeter of water at 4° C is taken as unity.

The values given are numerically equal to the absolute density in grams per milliliter.

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D, the density at absolute temperature T and pressure P.

The density of **moist** air may be determined by a similar relation:

$D = 1.2929\ (273.13/T)\ [(B - 0.3783e)/760]$ where T is the absolute temperature; B, the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The **first factor,** $1.2929\ (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The **second factor,** $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l.

To facilitate obtaining **approximate values** of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density.

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833 \text{ g/l.}$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

$(1.2929 \times 273.13/T)$

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

DENSITY OF MOIST AIR (Continued)

TABLE III

Pressure Factor.—[$(B - 0.3783e)/760$]

The figures in the body of the table give values of the whole term $(B - 0.3783e)/760$] for various values of the numerator $(B - 0.3783e)$ expressed at the left and top.

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B - 0.3783e$). The latter may be obtained by use of Table II.

ELASTIC CONSTANTS FOR SOLIDS

The following table gives values for the yield point (or elastic limit, indicated by e.), ultimate tensile strength Young's modulus and the modulus of rigidity in kg/mm². The Brinell hardness number is also given, representing the ratio of load in kilograms on a sphere used to indent material to the spherical area of the indentation in square millimeters.

YIELD POINT, TENSILE STRENGTH, BRINELL HARDNESS

Material	Yield point		Ultimate tensile strength		Brinell hardness number
	Kg/mm²	Lbs./in.²	Kg/mm²	Lbs./in.²	
		×10³		×10³	
Aluminum 99.97, annealed	....	....	5.96	8.48	16
99.5, cast	....	....	7.95	11.31	....
hot rolled	10.2	14.51	11.34	16.13	....
cold "	13.2	18.77	14.71	20.92	....
99 3, rolled	....	....	19.7–24.6	28.02–34.99	39

ISOTHERMAL COMPRESSIBILITY OF LIQUIDS

Compiled by John C. McGowan

The figures in this table are for isothermal compressibilities in c.g.s. units at one atmosphere. The effect of pressure (P) upon the isothermal compressibility (x_T) is usually well expressed by the empirical equation of Tait

$$x_T = \frac{C}{L + P}$$

C is a constant for a given substance. C is independent of temperature and is usually close to 0.1 (in some books instead of C, figures are given for 2.3026 C). For a given substance L is a constant at a given temperature.

ELASTIC CONSTANTS FOR GASES

For short ranges of pressure, at a constant temperature, the volume of a gas is inversely proportional to the pressure or pressure × volume = a constant. (Boyle's Law.)

For high pressures, the table below shows the relative volumes at various temperatures. The volume at 0° C. and 76 cm. pressure (1 atmosphere) being taken as 1,000,000.

(From Smithsonian Tables.)

COEFFICIENT OF FRICTION

(From Rankine's Compilation, 1858; Smithsonian Tables.)

Materials.	Coefficient of friction.	Angle of repose in degrees.
Wood on wood, dry	.25–.50	14.0–26.5
Wood on wood, soapy	.20	11.5
Metals on oak, dry	.50–.60	26.5–31.0
Metals on oak, wet	.24–.26	13.5–14.5
Metals on oak, soapy	.20	11.5
Metals on elm, dry	.20–.25	11.5–14.0
Hemp on oak, dry	.53	28.0
Hemp on oak, wet	.33	18.5
Leather on oak	.27–.38	15.0–19.5
Leather on metals, dry	.56	29.5
Leather on metals, wet	.36	20.0
Leather on metals, greasy	.23	13.0
Leather on metals, oily	.15	8.5
Metals on metals, dry	.15–.20	8.5–11.5
Metals on metals, wet	.3	16.5
Smooth surfaces occasionally greased	.07–.08	4.0–4.5
Smooth surfaces continually greased	.05	3.0
Smooth surfaces, best results	.03–.036	1.75–2.0
Steel on agate, dry	.20	11.5
Steel on agate, oiled	.107	6.1
Iron on stone	.30–.70	16.7–35.0
Wood on stone	about .40	22.0
Masonry and brick work, dry	.60–.70	33.0–35.0
Masonry and brick work, damp mortar	.74	36.5
Masonry on dry clay	.51	27.0
Masonry on moist clay	.33	18.25
Earth on earth	.25–1.00	14.0–45.0
Earth on earth, dry sand, clay and mixed earth	.38–.75	21.0–37.0
Earth on earth, damp clay	1.00	45.0
Earth on earth, wet clay	.31	17.0
Earth on earth, shingle and gravel	.81–1.11	39.0–48.0

RESISTANCE TO CRUSHING FOR VARIOUS MATERIALS

Approximate values in pounds per square inch.

Material.	Resistance to crushing in lbs. per sq. in.	Material.	Resistance to crushing in lbs. per sq. in.
Brick:		Granite	9700–34000
soft burned	3000–6000	Limestone	6000–25000
hard burned	4500–6500	Marble	7600–20700
vitrified	8500–25000	Sandstone	2400–29300
Brownstone	7300–23600	Tufa	7700–11600
Concrete	800–3800		

TENSILE STRENGTH OF METALS

(Selected from Smithsonian Tables.)

Given in pounds per square inch. The values can be considered only as approximations.

Metal	Tensile Strength in lbs. per sq. in.
Aluminum wire	30000–40000
Brass wire	50000–150000
Bronze wire, phosphor, hard drawn	110000–140000
Bronze wire, silicon, hard drawn	95000–115000
Bronze	60000–75000
Cobalt, cast	33000
Copper wire, hard drawn	60000–70000
German silver	40000–50000
Gold wire	20000
Iron, cast	13000–33000
Iron wire, hard drawn	80000–120000
Iron wire, annealed	50000–60000
Lead, cast or drawn	2600–3300
Magnesium, hard drawn	33000
Monel metal, cold drawn	80000–100000
Nickel, hard drawn	155000
Palladium	39000
Platinum wire	50000
Silver wire	42000
Steel	40000–330000
Steel wire, maximum	460000
Steel, specially treated nickel steel	250000
Steel, piano wire, 0.033 in. diam	357000–390000
Steel, piano wire, 0.051 in. diam	325000–337000
Tantalum	130000
Tin, cast or drawn	4000–5000
Tungsten, hard drawn	590000
Zinc, cast	7000–13000
Zinc, drawn	22000–30000

Geller, "A Study of Ceramics for Nuclear Reactors," Nucleonics, Vol. 7, No. 4, Table 1, pp. 8–9 (Oct. 1950). V. E. Lysaght, *Indentation Hardness Testing*, Reinhold 1949.

SURFACE TENSION

Compiled by T. Fraser Young and William D. Harkins

Meaning of Symbols

γ = the surface tension in dynes per centimeter.

$\Delta\gamma$ = the surface tension of a solution minus the surface tension of the pure solvent.

-- air, means that the liquid was in contact with air (saturated with its own vapor).

-- vapor, means that the liquid was in contact with its own vapor.

-- N_2 and -- H_2 have corresponding meanings.

-- also designates the surface between a pair of liquids at which the interfacial tension was determined.

% = weight % of the solute (i. e. the organic substance).

f = gram formula weights per 1000 grams of solvent (i. e. water).

°C = degrees Centigrade.

°K = degrees Kelvin or Absolute. Temperature in °C = Temperature in °K − 273.1.

M.P., at the melting point.

k_E = the Eötvös Constant, in erg mole$^{-\frac{2}{3}}$ degree^{-1}.

$$-k_E = \frac{d\,\Gamma}{d\,t} = \frac{d\,(M/d)^{\frac{2}{3}}\ \gamma}{d\,t}$$

where $\Gamma = \gamma\,(M/d)^{\frac{2}{3}}$

M = mass of one gram formula weight of the substance

d = density of the substance.

AQUEOUS SOLUTIONS AGAINST AIR

INORGANIC

(f = gram formula weights per 1000 grams of solvent.)

For the following aqueous solutions the values of $\Delta\gamma$ are given. $\Delta\gamma$ is the difference between the surface tension of the solution and that of the solvent at the same temperature. Positive values of $\Delta\gamma$ mean that the surface tension of the solution is greater than that of the solvent. Negative values, the reverse. For convenience in computing the surface tension, the current accepted value for the surface tension of water at the stated temperature is given in the second column.

Formula	°C (γH_2O)		$\Delta\gamma$ for concentrations indicated							
$CaCl_2$	25	f	.1	.5	1.0	2.0	3.0	5.0	11.2	
	(71.97)	$\Delta\gamma$	.35	1.5	3.2	6.9	11.0	18.4	35.

VISCOSITY

The **viscosity** of a substance is defined as the tangential force per unit area of either of two horizontal planes at unit distance apart, one of which is fixed, while the other moves with unit velocity, the space being filled with the substance.

In the case of a liquid flowing slowly through a long tube of small diameter, the volume V of liquid which escapes in a time t is given by the equation,

$$V = \frac{\pi p r^4}{8 l \eta} t$$

where p is the difference in pressure between the two ends of the tube; r, its radius; l, its length, and η, the viscosity. (Law of Poiseuille.)

A more complete equation is now generally used:

$$\eta = \frac{\pi d g r^4 t}{8Q(l + \lambda)} \left(h - \frac{mv^2}{g} \right)$$

where η is the viscosity; d, the density in g/cm^3; r, the radius, and l, the length, of the tube in cm; Q, the volume in cm^3 discharged in t sec.; λ, a correction to the length of the tube; h, the average head in cm; m, the coefficient of the kinetic energy correction, mv^2/g; g, the acceleration due to gravity in cm/sec.^{2}; v, the mean velocity in cm/sec. See Technologic Papers of the Bureau of Standards 100 and 112, 1917 and 1918, for a full discussion.

Viscosity is expressed in dyne-seconds per cm^2 or poises. The centipoise (cp) is 0.01 poise.

Specific viscosity is the ratio of the viscosity of any substance to that of water at 0° C or other specified temperature. Since the viscosity of water at 20° C is 1.0050 centipoises, the viscosity of any substance expressed in centipoises is approximately equal to its specific viscosity referred to water at 20° C.

Kinematic viscosity is the ratio of the viscosity to the density.

Fluidity is the reciprocal of viscosity.

VISCOSITY OF WATER BELOW 0° C

White-Twining, 1914

Temperature	Viscosity centipoises	Temperature	Viscosity centipoises
0° C	1.798	−7.23	2.341
−2.10	1.930	−8.48	2.458
−4.70	2.121	−9.30	2.549
−6.20	2.250		

ABSOLUTE VISCOSITY OF WATER AT 20°C

Swindells, J. R. Coe, Jr., and T. B. Godfrey, Journal of Research, National Bureau of Standards **48,** 1, 1952.

The value found for the viscosity of water at 20°C was 0.010019 ± 0.000003 poise.

The value **0.01002** poise is to be used as the absolute value of the viscosity of water for calibration purposes.

VISCOSITY CONVERSION TABLE

Poise = c.g.s. unit of absolute viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm}}$

Stoke = c.g.s. unit of kinematic viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm} \times \text{density}_{(t°\text{F})}}$

Centipoise = 0.01 poise
Centistoke = 0.01 stoke
Centipoises = Centistokes × density (at given temperature)

To convert poises to $\frac{\text{lb}}{\text{sec} \times \text{ft}}$ or $\frac{\text{lb}}{\text{hr} \times \text{ft}}$ multiply by 0.0672 or 242 respectively.

*100.0	462.0	462.9	465.2	404.9	408.2	416.7	13.16

---

* At higher values use the same ratio as above for 100 centistokes; e.g., 110 centistokes = 100 × 4.620 Saybolt seconds at 100°F.

To obtain the Saybolt Universal viscosity equivalent to a kinematic viscosity determined at t°F, multiply the equivalent Saybolt Universal viscosity at 100°F by $1 + (t - 100)0.000064$; e.g., 10 centistokes at 210°F are equivalent to 58.8 × 1.0070, or 59.2 Saybolt Universal seconds at 210°F.

VISCOSITY AND FLUIDITY OF WATER

PHYSICAL CONSTANTS OF OZONE AND OXYGEN

Armour Research Foundation, 1958

Physical Constant	Ozone (O_3)	Oxygen (O_2)
Molecular Weight	48.0 g/g mol	32.0 g/g mol
Boiling Point (760 mm)	−111.9 ± 0.3°C	−182.96°C
Melting Point	−192.7 ± 0.2°C	−218.4°C
Critical Temperature	−12.1 ± 0.1°C	−118.8°C
Critical Pressure	54.6 atm	49.7 atm
Critical Density	0.437 g/cc	0.430 g/cc
Critical Volume	147.1 cc/mol	74.5 cc/mol
Gas Density (0°C) (760 mm pressure)	2.144 g/liter	1.429 g/liter
Liquid Density		
−112°C	1.358 g/cc	
−183°C	1.571 g/cc	1.14 g/cc
−195.4°C	1.614 g/cc	1.201 g/cc
Surface Tension		
−195°C	43.8 ± 0.1 dyne/cm	
−182.7°C	38.1 ± 0.2 dyne/cm	
−183.0°C	38.4 ± 0.7 dyne/cm	13.2 dyne/cm
Heat Capacity of Liquid		
−183 to −145°C	0.45 cal/g°C	
Heat Capacity of Gas		
−173°C	7.95 cal/g mol°C	
0°C	9.10 cal/g mol°C	
25°C	9.37 cal/g mol°C	
100°C		6.979 cal/g mol°C
127°C	10.44 cal/g mol°C	
Viscosity of Liquid		
−195.6°C	4.14 ± 0.05 cp	
−183.0°C	1.57 ± 0.02 cp	0.189 cp
Heat of Vaporization		
−112°C	75.6 cal/g	
−182.9°C		50.9 cal/g

PHYSICAL CONSTANTS OF OZONE AND OXYGEN (Continued)

Physical Constant	Ozone (O_3)	Oxygen (O_2)
Heat of Formation		
25°C	−34.4 Kg cal/mol	
Free Energy		
25°C	32.4 Kg cal/mol	
Van der Waals Constant (a)	3.545 atm $liter^2/mol^2$	1.36 atm $liter^2/mol^2$
Van der Waals Constant (b)	0.04903 liter/mol	0.03803 liter/mol
Magnetic Susceptibility		
gas ($\times 10^{-6}$)	0.002 cgs units	10.6.2 cgs units
liq ($\times 10^{-6}$)	0.150 cgs units	260.0 cgs units
Thermal Conductivity of Liquid		
−195.8°C	5.21 cal/sec cm°C $\times 10^4$	
−183.0°C	5.31 cal/sec cm°C $\times 10^4$	
−165.0°C	5.42 cal/sec cm°C $\times 10^4$	
−128.0°C	5.52 cal/sec cm°C $\times 10^4$	

Phase Boundaries—Ozone-Oxygen System

−183°C	29.8 and 72.4 wt % O_3
−195.4°C	9 and 90.8 wt %O_3

Consolute Temperature—Ozone-Oxygen System

−180 ± 0.5°C

Coefficient of Thermal Expansion for Liquid Ozone

Temp. °C	α
−195.6	1.62
−183.0	1.58
−148.0	1.47
−123.0	1.41
−112.0	1.35
− 98.8	1.31

COEFFICIENT OF THERMAL EXPANSION

LINEAR

The coefficient given is the increase in length per unit length (measured at 0° C.) per degree Centigrade.

THERMAL EXPANSION OF GLASSES

The following table gives the mean coefficient of linear expansion for various types of glass as determined by Peters and Cragoe of the Bureau of Standards. 1920.

Glass sample	Temp. interval	Coefficient	Temp. interval	Coefficient
		$\times 10^{-4}$		$\times 10^{-4}$
1 Barium flint	22–494	0.088	519–550	0.331
4 Plate, American	20–508	.108	540–560	.401
6 German	21–496	.099	564–589	.477
7 French	21–513	.094	597–613	.424
8 Light crown	24–422	.104	494–507	.548
10 Borosilicate crown	22–498	.090	539–562	.393
11 Barium crown	23–499	.090	589–610	.649
12 Medium flint	23–402	.097	452–478	.396
13 Light flint	22–451	.088	494–512	.347
16 Commercial glass	23–445	.107	510–534	.309
20 McBeth-Evans flask	22–449	.069	567–586	.454
21 Pyrex	21–471	.036	552–571	.151
22 Schott-Genossen flask	19–414	.056	540–562	.404
23 Soda tubing	21–372	.120	506–525	.234
24 Lead tubing	21–338	.091	464–483	.236
26 Fluorite tubing	22–364	.098	510–551	.284
29 Fusing in glass, German	23–383	.090	456–481	.283
30 Fusing in glass, Corning	22–376	.083	460–485	.258

EQUATION FOR THE LINEAR EXPANSION OF SOLIDS

If l_0 is the length at 0° C the length at t° C is $l_t = l_0\ (1+\alpha t+\beta t^2)$. The table gives the values of these coefficients.

Substance	Temp. limits ° C	α	β	Observer
Aluminum	10–90	$.2221 \times 10^{-4}$	$.114 \times 10^{-7}$	Fizeau
Brass	10–90	.1781	.098	Fizeau

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion for a solid is approximately three times the linear coefficient.

The experimental values for various solids are given in the following table. The coefficient is the increase in volume per unit volume per degree Centigrade.

Substance	Temp. ° C	Coefficient	Observer
Antimony	0–100	0.3167×10^{-4}	Matthiessen
Asphalt	....	5–7	....
Beryl	0–100	0.3167	Pfaff

REDUCTION OF GAS VOLUME TO NORMAL CONDITIONS

Factors and their logarithms for reducing a gas volume to normal conditions, 0° C., 760 mm pressure.

The volume of *dry* gas measured at any temperature 10–35° C. inclusive and pressure 690–784 mm of Hg may be reduced to the volume at 0° C. (273.18° K.) and 760 mm of Hg pressure by multiplying by the factor found in the table.

In case the volume of gas is measured in the presence of water vapor the pressure of the aqueous vapor must be subtracted from the value of the total or barometric pressure before entering the table. In the case of atmospheric air the vapor pressure may be found by determining the dew point or temperature of saturation. The pressure of water vapor may then be read from the small table below. If gas volumes are measured over water, the vapor pressure will be that of saturated aqueous vapor at the temperature used. A table giving the pressure of saturated aqueous vapor over water is given below.

Pressure of Saturated Water Vapor

°C.	mm	°C.	mm	°C.	mm
9	8.6	18	15.5	27	26.7
10	9.2	19	16.5	28	28.3

Heat Capacity of Air-free Water 0°–100°C at 1 Atmosphere Pressure

The heat capacity of air-free water is given in international steam table calories per gram and in absolute joules per gram. (1 absolute joule—0.238846 I.T. Cal.).

The enthalpy or heat content is given for air-free water in I.T. Cal. per gram and in absolute joules per gram.

From Osborne, Stimson and Ginnings; B. of S. Jour. Res. **23**. 238, 1939.

HEAT CAPACITY OF MERCURY

The specific heat of solid mercury is given in relation to water at 15°C The values are from Carpenter and Stoodley, Phil. Mag. **10,** 249, 1930. Heat capacity is given in calories per gram and in calories per gram atom (1 cal = 4.1840 absolute joules and the atomic weight of mercury 200.61). Values for the liquid and vapor are from Douglas, Ball and Ginnings, Jour of Res. Bureau of Standards **46,** 334, 1951.

SPECIFIC HEAT OF SOLID INORGANIC COMPOUNDS

Specific heat is given in calories (15°) per gram per degree Centigrade. To change to joules per gram per degree Centigrade multiply by 4.185.

Name	Formula	Temperature, °C.	Specific Heat Cal. 15°/g/°C.
Aluminum chloride	$AlCl_3$		.188
chloride	$AlCl_3 6H_2O$	35	.313

COLOR SCALE OF TEMPERATURE

This table is the result of an effort to interpret in terms of thermometric readings, the common expressions used in describing temperatures. It is obvious that the values are only approximations.

Color.	Temperature, °C.
Incipient red heat	500–550
Dark red heat	650–750
Bright red heat	850–950
Yellowish red heat	1050–1150
Incipient white heat	1250–1350
White heat	1450–1550

SPECIFIC HEAT OF AQUEOUS SOLUTIONS

Giving the specific heat referred to that of water at the same temperatures. Concentration of the solutions is stated as the number of molecules of water to each molecule of the solutes (anhydrous).

Values from Marignac, Thomsen and others.

Substance	Temp. °C.	Concentration		
		25	50	100

SPECIFIC HEAT OF AQUEOUS SOLUTIONS
(Continued)

Giving the specific heat referred to that of water at the same temperatures. Concentration of the solutions is stated as the number of molecules of water to each molecule of the solutes (anhydrous).

Values from Marignac, Thomsen and others.

Substance	Temp. °C.	Concentration		
		25	50	100
Potassium oxalate	21–52	.....	0.839	0.908
sulfate	19–52	.....	.....	0.902
Silver nitrate	25–52	0.750	0.849	0.913
Sodium acetate	18	.....	0.938	0.965
bromide	20–52	0.809	0.886	0.939
carbonate	21–52	0.865	0.907	0.943
chloride	18	0.880	0.931	0.962
chromate	21–52	0.781	0.856	0.913
hydroxide	18	0.908	0.942	0.968
iodide	20–51	0.749	0.850	0.917
nitrate	18	0.863	0.918	0.950
sulfate	21–52	0.819	0.878	0.960
Strontium chloride	21–26	.....	0.814	0.894
nitrate	19–51	.....	0.817	0.890
Sulfuric acid	20	0.963	0.982	0.991
Zinc chloride	19–51	0.796	0.884	0.933
nitrate	20–52	0.718	0.823	0.899
sulfate	20–52	.....	0.842	0.911

SPECIFIC HEAT OF GASES

The following table gives values of the specific heat at constant pressure in calories per gram and the value of γ, the ratio of the specific heat at constant pressure to that at constant volume. Values are given for pressures of one atmosphere except where otherwise stated.

Gas or vapor	Sp. ht., const. press.			Value of γ		
	Temp. °C	Sp. ht. cal./g	Obs.	Temp. °C	γ	Obs.
Acetaldehyde, C_2H_4O	......	......	......	30	1.14	39

[*] The data in this table are compiled from various sources,— hence the variations in the melting point of the metals as shown in this column.

MELTING AND BOILING TEMPERATURES

Temperature of Fusion for Various Substances for Atmospheric Pressure

For the melting- and boiling-points of the chemical elements and of inorganic compounds see under Physical Constants of the Elements, and Physical Constants of Inorganic Compounds.

Substance.	Temp. of fusion ° C.	Substance.	Temp. of fusion ° C.
Acetylene	−81	German silver	1000.
Alcohol, ethyl	−130.	Glass	1100.
Brass	900.	Glycerine	17.
Butter	31–31.5	Olive oil	2–6
Camphor	177.7	Paraffin	55.
Caoutchouc, pure gum	120.	Resin	135.
Chloroform	−63.2	Sea water	−2.5
Ether	−117.6	Sugar (cane)	160.

Boiling-point for Various Substances

Giving the boiling-point at atmospheric pressure and the variation per cm. pressure near 76 cm.

Substance.	Temp. ° C.	Variation.
Acetone	57.	0.39
Acetylene	−72.2	
Alcohol, ethyl	78.3	0.34
methyl	64.7	0.35
Amyl acetate	148.	
Benzene	80.	0.43
Camphor	205.	0.56
Chloroform	61.2	0.41
Ether	34.6	0.40
Gasoline	70–90.	
Glycerine	291.	
Turpentine	159.	

MELTING POINT OF ICE—VARIATION WITH PRESSURE

(From Tamann, 1900, by permission.)

Pressure in kg. per sq.cm.	Temp. ° C.	Pressure in kg. per sq.cm.	Temp. ° C.
1	0.0	1410	−12.5
336	− 2.5	1625	−15.0
615	− 5.0	1835	−17.5
890	− 7.5	2042	−20.0
1155	−10.0	2200	−22.1

BOILING POINTS OF WATER-ALCOHOL MIXTURES

(P. N. Evans, Journal of Industrial and Engineering Chemistry.)

Boiling point, °C.	Weight per cent alcohol in		Boiling point, °C.	Weight per cent alcohol in

MOLECULAR ELEVATION OF THE BOILING POINT

(Most values from Hoyt, C.S. and Fink, C.K., Journal of Physical Chemistry, Vol. 41, No. 3., March, 1937.)

Molecular elevation of the boiling point showing the elevation of the boiling point in degrees C due to the addition of one gram molecular weight of the dissolved substance to 1000 grams of any one of the solvents below. The correction in the last column gives the number of degrees to be subtracted for each mm. of difference between the barometric reading and 760 mm.

Solvent	K_B	Barometric Correction per mm.
Acetic acid	3.07	0.0008
Acetone	1.71	0.0004
Aniline	3.52	0.0009
Benzene	2.53	0.0007
Bromobenzene	6.26	0.0016
Carbon bisulfide	2.34	0.0006
Carbon tetrachloride	5.03	0.0013
Chloroform	3.63	0.0009
Cyclohexane	2.79	0.0007
Ethanol (ethyl alcohol)	1.22	0.0003
Ethyl acetate	2.77	0.0007
Ethyl ether	2.02	0.0005
n-Hexane	2.75	0.0007
Methanol (methyl alcohol)	0.83	0.0002
Methyl acetate	2.15	0.0005
Nitrobenzene	5.24	0.0013
n-Octane	4.02	0.0010
Phenol	3.56	0.0009
Toluene	3.33	0.0008
Water	0.512	0.0001

MOLECULAR DEPRESSION OF THE FREEZING POINT

Showing the depression of the freezing point due to the addition of one gram molecular weight of dissolved substance, for various solvents.

Solvent	Depression for one gram molecular weight dissolved in 100 gms. °C
Acetic acid	39.0
Benzene	49.0
Benzophenone	98.0
Diphenyl	80.0
Diphenylamine	86.0
Ethylene dibromide	118.0
Formic acid	27.7
Naphthalene	68–69
Nitrobenzene	70.0
Phenol	74.0
Stearic acid	45.0
Triphenyl methane	124.5
Urethane	51.4
Water	18.5–18.7

LOWERING OF FREEZING POINT FOR AQUEOUS SOLUTIONS

The concentration of the solutions is expressed as the number of gram formula weights per 1,000 grams of water. The table gives the molal lowering of freezing point in °C for the concentration stated.

Solute	Concentration										
	0.001	0.005	0.01	0.02	0.05	0.1	0.2	0.5	1.0	2.0	5.0
$AgNO_3$	.....	.....	3.60	3.54	3.42	3.32	3.20	2.96	2.63	2.16	....

CORRECTION OF BOILING POINTS TO STANDARD PRESSURE

By H. B. Hass and R. F. Newton

This correction may be made by using the equation:

$$\Delta t = \frac{(273.1 + t)(2.8808 - \log p)}{\phi + .15(2.8808 - \log p)} \qquad (1)$$

where Δt = degrees C to be added to the observed boiling point.
t = the observed boiling point.
$\log p$ = the logarithm of the observed pressure in millimeters of mercury.
ϕ = the entropy of vaporization at 760 mm.

The value of ϕ may be estimated from the graph and the table. Substances not included in the table may be classified by grouping them with compounds which bear a close physical or structural resemblance to them.

Example 1. Benzene boils at 20°C. at 75 mm pressure. What is its normal boiling point? We do not find benzene in the table but we find hydrocarbons in group 2, and a group 2 compound with a boiling point of 20° has a ϕ of 4.6.

Substituting in the equation:

$$\Delta t = \frac{(273.1 + 20)(2.8808 - 1.8751)}{4.60 + .15(2.8808 - 1.8751)} = 62°$$

Adding this to 20° gives 82° as a first approximation.

The graph shows that the ϕ for a compound of group 2 boiling at 82° is 4.72 instead of 4.60 which we originally used. Since ϕ is in the denominator, this increase will lower our Δt by the ratio, $\frac{4.60}{4.72}$, or the corrected Δt is $62 \times \frac{4.60}{4.72} = 60.4$. Adding Δt to t, gives 80.4° as a second approximation.

The formula can best be used in a slightly different form when the reverse calculation is desired, *i.e.*, when one calculates the vapor pressure at a given temperature, lower than the normal boiling point.

$$2.8808 - \log p = \frac{\phi \Delta t}{273.1 + t - .15\Delta t} \qquad (2)$$

Example 2. Alcohol boils at 78.4°C. What is its vapor pressure at 20°C.? Substituting in equation 2:

$$2.8808 - \log p = \frac{6.06 \times 58.4}{293.1 - (.15 \times 58.4)} = 1.245$$

$$\log p = 2.8808 - 1.245 = 1.6358$$

$$p = 43.2 \text{ mm.}$$

Here no second approximation is necessary, since the correct value of ϕ was taken immediately, the normal boiling point having been known.

VAN DER WAALS' CONSTANTS FOR GASES

(Calculated from Amagat units in Landbolt-Bornstein Physical Chemical Tables)

Van der Waals' equation is an equation of state for real gases. It may be written

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT \text{ for one mole.}$$

or

$$\left(P + \frac{n^2a}{V^2}\right)(V - nb) = nRT \text{ for } n \text{ moles.}$$

The term a is a measure of the attractive force between the molecules. The term b is due to the finite volume of the molecules and to their general incompressibility. It is known that a and b vary to some extent with temperature.

The values for a and b in the following table are those to be used when the pressure is in atmospheres and the volume is in liters. Thus R in the above equation will be 0.08206 liter atmospheres per mole per degree. T is degrees Kelvin.

Name	Formula	a	b
		$\frac{(\text{liters})^2 \times \text{atm.}}{(\text{mole})^2}$	$\frac{\text{liters}}{\text{mole}}$

CHANGE IN VOLUME DUE TO FUSION

The table gives the variation in volume expressed in c.cm. for one gram of the substance.

Substance.	Variation, cm.^{3}/g	Observer.
Aluminum.	+0.019	Toepler, 1894
Bismuth.	−0.0034	Toepler, 1894
Cadmium.	+0.0064	Toepler, 1894
Iron.	−0.0085	Wrightson, Roberts, 1881
Lead.	+0.0034	Toepler, 1894
Tin.	+0.0039	Toepler, 1894
Water	−0.083*	Toepler, 1894
Zinc.	+0.0105	Toepler, 1894

*For one cubic centimeter.

FIXED TEMPERATURE FOR THERMOMETER CALIBRATION

Corrections for pressure are indicated by equations in which p indicates pressure in millimeters of mercury. and t the boiling point at normal pressure.

Points designated by an asterisk (*) are suggested by E. F. Mueller as base points to be used in defining a Standard Working Scale.

Substance	Point	Temperature thermodynamic scale °C	Condition or correction
Hydrogen.	Boiling	−252.75	$+0.0044\ (p-760)$
Nitrogen.	Vapor pressure	−195.80	$+0.0109\ (p-760)$
Liquid O_2*.	Vapor pressure	−183.00	$+0.0126\ (p-760)$ $-0.0000065\ (p-760)^2$

EMERGENT STEM CORRECTION FOR LIQUID-IN-GLASS THERMOMETERS

Accurate thermometers are calibrated with the entire stem immersed in the bath which determines the temperature of the thermometer bulb. However, for reasons of convenience it is common practice when using a thermometer to permit its stem to extend out of the apparatus. Under these conditions both the stem and the mercury in the exposed stem are at a temperature different from that of the bulb. This introduces an error into the observed temperature. Since the coefficient of thermal expansion of glass is less than that of mercury, the observed temperature will be less than the true temperature if the bulb is hotter than the stem and greater than the true temperature, providing the thermal gradient is reversed. For exact work the magnitude of this error can only be determined by experiment. However, for most purposes it is sufficiently accurate to apply the following equation which takes into account the difference of the thermal expansion of glass and mercury:

$$T_c = T_o + F \times L(T_o - T_m)$$

Where T_c = corrected temperature
T_o = observed temperature
T_m = mean temperature of exposed stem. The mean temperature of the exposed stem may be determined by fastening the bulb of a second thermometer against the midpoint of the exposed liquid column.
L = the length of the exposed column in degrees above the surface of the substance whose temperature is being determined.
F = correction factor. For approximate work and when the liquid in the thermometer is mercury a value for F of 0.00016 is generally used. For more accurate work with mercury filled thermometers values as given in the following table are used. For thermometers filled with organic liquids it is customary to use 0.001 for the value of F.

Values of F for various glasses

VAPOR PRESSURE OF MERCURY

Vapor pressure of mercury in mm. of Hg for temperatures from −38 to 400°C. Note that the values for the first four lines only, are to be multiplied by 10^{-6}.

Temp. °C	0	2	4	6	8
	10^{-6}	10^{-6}	10^{-6}	10^{-6}	10^{-6}

* Undercooled liquid.

Critical temperature = 31.0°C. Triple point, −56.602 ± 0.005°C; 3885.2 ± 0.4 mm.

VAPOR PRESSURE

The following table is an abridged form of the very extensive compilation by Daniel R. Stull and published in Industrial and Engineering Chemistry **39**, 517 (1947).

The table gives the temperatures in degrees centigrade at which the vapor of the compound listed at the left has the pressure indicated at the top of the column. Organic compounds are listed in the order of their empirical formulae and inorganic compounds in the alphabetic order of their names. Pressures greater than one atmosphere are listed in separate tables.

Abbreviations:
d = decomposes
d = dextrorotatory
dl = inactive (50% *d* and 50% *l*)
e = explodes
l = levorotatory
M.P. = melting point
p = polymerizes
s = solid

VAPOR PRESSURE

Variation with Temperature

The following table gives the value of the constants *a* and *b* in the following equation:

$$\log_{10} p = -\frac{0.05223a}{T} + b$$

where *p* is the pressure in mm of mercury of the saturated vapor at the absolute temperature *T*. ($T = t°C + 273.1$). The values obtained by the use of the equation given above are valid within the temperature ranges indicated for each of the compounds.

Elements and Inorganic Compounds

Compound	Formula	Temp. range °C	*a*	*b*
Aluminum oxide	Al_2O_3	1840 to 2200 liq.	540,000	14.22
Ammonia	NH_3	−127 to −78 sol.	31,211	9.9974
Ammonium bromide	NH_4Br	250 to 400 sol.	90,208	9.9404
Ammonium chloride	NH_4Cl	100 to 400 sol.	83,486	10.0164
Ammonium cyanide	NH_4CN	7 to 17 sol.	41,484	9.978
Ammonium iodide	NH_4I	300 to 400 sol.	95,730	10,2700
Ammonium sulfhydrate	NH_4HS	6 to 40 sol.	46,025	10.7500
Antimony	Sb	1070 to 1325 liq.	189,000	9.051
Argon	A	−208 to −189 sol.	7,814.5	7.5741
		−189 to −183 liq.	6,826.0	6.9605
Arsenic	As	800 to 860 liq.	47,100	6.692
		440 to 815 sol.	133,000	10.800
Arsenous oxide	As_2O_3	100 to 310 sol.	111,350	12.127
		315 to 490 liq.	52,120	6.513
Barium	Ba	930 to 1130 liq.	350,000	15.765
Bismuth	Bi	1210 to 1420 liq.	200,000	8.876
Bismuth trichloride	$BiCl_3$	91 to 213 sol.	13,125	2.681
Cadmium	Cd	150 to 320.9 sol.	109,000	8.564
		500 to 840 liq.	99,900	7.897
Cadmium iodide	CdI_2	385 to 450 liq.	122,200	9.269
Caesium	Cs	200 to 350 liq	73,400	6.949
Caesium chloride	CsCl	986 to 1295 liq	163,200	8.340

VAPOR PRESSURE (Continued)

Compound	Formula	Temp. range °C	*a*	*b*
Calcium	Ca	960 to 1110 liq.	370,000	16.240
Carbon	C	3880 to 4430 liq.	540,000*	9.596*
Carbon dioxide	CO_2	−135 to −56.7 sol.	26,179.3	9.9082
Carbon monoxide	CO	−290 to −206 liq.	6,354	6.976
Chlorine	Cl	−154 to −103 sol.	29,293	9.950
Cobalt	Co	2375 liq.	309,000	7.571
Copper	Cu	2100 to 2310 liq.	468,000	12.344
Cuprous chloride	Cu_2Cl_2	878 to 1369 liq.	80,700	5.454
Cyanogen	$(CN)_2$	−72 to −28 sol.	32,437	9.6539
		−32 to −6 liq.	23,750	7.808
Ferrous chloride	$FeCl_2$	700 to 930 sol.	135,200	8.33
Gold	Au	2315 to 2500 liq.	385,000	9.853
Hydriodic acid	HI	−97 to −51 sol.	24,160	8.259
		−50 to −34 liq.	21,580	7.630
Hydrobromic acid	HBr	−114 to −86 sol.	22,420	8.734
		−86 to −66 liq.	17,960	7.427
Hydrochloric acid	HCl	−158 to −110 sol.	19,588	8.4430
Hydrocyanic acid	HCN	−8 to +27 liq.	27,830	7.7446
Hydrofluoric acid	HF	−83 to +48 liq.	25,180	7.370
Hydrogen peroxide	H_2O_2	10 to 90 liq.	48,530	8.853
Hydrogen sulfide	H_2S	−110 to −83 sol.	20,690	7.880
Iron	Fe	2220 to 2450 liq.	309,000	7.482
Krypton	Kr	−189 to −169 sol.	10,065	7.1770
		−169 to −150 liq.	9,377.0	6.92387
Lead	Pb	525 to 1325 liq.	188,500	7.827
Lead bromide	$PbBr_2$	735 to 918 liq.	118,000	8.064
Lead chloride	$PbCl_2$	500 to 950 liq.	141,900	8.961
Lithium bromide	LiBr	1010 to 1265 liq.	152,700	8.068
Lithium chloride	LiCl	1045 to 1325 liq.	155,900	7.939
Lithium fluoride	LiF	1398 to 1666 liq.	218,400	8.753
Lithium iodide	LiI	940 to 1140 liq.	143,600	8.011
Magnesium	Mg	900 to 1070 liq.	260,000	12.993

* Based on boiling point of 3927° C or 4200° absolute.

Compound	Formula	Temp. range °C	*a*	*b*
Manganese	Mn	1510 to 1900 liq.	267,000	9.300
Mercuric bromide	$HgBr_2$	111 to 235 sol.	79,800	10.181
		238 to 331 liq.	61,250	8.284
Mercuric chloride	$HgCl_2$	60 to 130 sol.	85,030	10.888
		130 to 270 sol.	78,850	10.094
		275 to 309 liq.	61,020	8.409
Mercuric iodide	HgI_2	100 to 250 sol.	82,340	10.057
		266 to 360 liq.	62,770	8.115

Tetrachloroethane-1, 1, 1, 2	$C_2H_2Cl_4$	105 to 145 liq.	36,508	7.605
Tetrachloroethane-1, 1, 2, 2	$C_2H_2Cl_4$	26 to 145 liq.	39,729	7.846
Toluene	C_7H_8	−92 to +15 liq.	39,198	8.330

LOWERING OF VAPOR PRESSURE BY SALTS IN AQUEOUS SOLUTIONS

The table gives the reduction of the vapor pressure in millimeters due to the presence of the number of grammolecules of salt per liter of water given at the head of the columns, at the temperature 100° C, at which temperature the vapor pressure of pure water is 760 millimeters.

HEAT CONDUCTIVITY

Giving the quantity of heat in calories which is transmitted per **second** through a plate one centimeter thick across an area of one square centimeter when the temperature difference is one degree Centigrade.

THERMAL CONDUCTIVITY OF MATERIALS

(Bureau of Standards Letter Circular No. 227)

D = Density in pounds per cubic foot.

K = Thermal conductivity in B.T.U. per hour, square foot, and temperature gradient of 1 degree Fahrenheit per inch thickness. The lower the conductivity, the greater the insulating values.

Soft Flexible Materials in Sheet Form

		D	K
Dry Zero	Kapok between burlap or paper..	1.0	0.24
		2.0	0.25
Cabots Quilt	Eel grass between kraft paper....	3.4	0.25
		4.6	0.26
Hair Felt	Felted cattle hair................	11.0	0.26
		13.0	0.26
Balsam Wool	Chemically treated wood fibre....	2.2	0.27
Hairinsul	75% hair 25% jute..............	6.3	0.27
	50% hair 50% jute..............	6.1	0.26
Linofelt	Flax fibres between paper........	4.9	0.28
Thermofelt	Jute and asbestos fibres, felted...	10.0	0.37
	Hair and asbestos fibres. felted...	7.8	0.28

Loose Materials

		D	K
Rock Wool	Fibrous material made from rock,	6.0	0.26
	also made in sheet form, felted and	10.0	0.27
	confined with wire netting.......	14.0	0.28
		18.0	0.29
Glass Wool	Pyrex glass, curled.............	4.0	0.29
		10.0	0.29
Sil-O-Cel	Powdered diatomaceous earth....	10.6	0.31
Regranulated	Fine particles..................	9.4	0.30
Cork	about 3/16 inch particles.........	8.1	0.31
Thermofill	Gypsum in powdered form........	26.	0.52
		34.	0.60
Sawdust	Various........................	12.0	0.41
	redwood........................	10.9	0.42
Shavings	Various, from planer............	8.8	0.41
Charcoal	From maple, beech and birch,		
	coarse.........................	13.2	0.36
	6 mesh.........................	15.2	0.37
	20 mesh........................	19.2	0.39

Semi-flexible Materials in Sheet Form

		D	K
Flaxlinum	Flax fibre......................	13.0	0.31
Fibrofelt	Flax and rye fibre..............	13.6	0.32

THERMAL CONDUCTIVITY OF MATERIALS (Continued)

SEMI-RIGID MATERIALS IN BOARD FORM

Corkboard	No added binder; very low density	5.4	0.25
Corkboard	No added binder; low density....	7.0	0.27
Corkboard	No added binder; medium density	10.6	0.30
Corkboard	No added binder; high density ..	14.0	0.34
Eureka	Corkboard with asphaltic binder .	14.5	0.32
Rock Cork	Rock wool block with binder..... Also called "Tucork"	14.5	0.326
Lith	Board containing rock wool, flax and straw pulp................	14.3	0.40

STIFF FIBROUS MATERIALS IN SHEET FORM

Insulite	Wood pulp....................	16.2	0.34
		16.9	0.34
Celotex	Sugar cane fibre...............	13.2	0.34
		14.8	0.34

*Masonite..............................	K = 0.33
*Inso-board............................	0.33
*Maizewood.............................	0.33 to 0.39
*Cornstalk Pith Board..................	0.24 to 0.30
*Maftex................................	0.34

CELLULAR GYPSUM

Insulex or Pyrocell..................	8	0.35
	12	0.44
	18	0.59
	24	0.77
	30	1.00

WOODS (Across Grain)

Balsa	7.3	0.33
	8.8	0.38
	20	0.58
Cypress..............................	29	0.67
White pine...........................	32	0.78
Mahogany.............................	34	0.90
Virginia pine........................	34	0.98
Oak..................................	38	1.02
Maple................................	44	1.10

MISCELLANEOUS BUILDING MATERIALS

(Data taken from various sources)

	K		K
Cinder concrete....	2 to 3	Limestone....	4 to 9
Building gypsum....	About 3	Concrete...........	6 to 9
Plaster............	2 to 5	Sandstone..........	8 to 16
Building brick......	3 to 6	Marble............	14 to 20
Glass..............	5 to 6	Granite............	13 to 28

* From various commercial laboratories and the work of O. R. Sweeney at Iowa State College.

SATURATED STEAM TABLES

TEMPERATURE OF SATURATED STEAM

The following table gives the temperature of saturated water vapor in degrees Centigrade and degrees Fahrenheit corresponding to gauge pressure in pounds from 0 to 3184. Zero gauge pressure corresponds to an absolute pressure of 14.696 pounds per square inch.

Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C	Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C	Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C
0	212.0	100.0	**55**	302.5	150.3	**110**	344.1	173.4

* Critical point.

The heat units used are the large calorie, 15° to 16° C and the B.T.U., 62° to 63° F. The heat of the liquid, q, is the heat required to raise unit mass of water from 0° C (32° F) to the temperature indicated. The heat of vaporization, r, is the heat required to vaporize unit mass of water at the indicated temperature and pressure. Total heat involved, $H = r + q$.

The heat of vaporization overcomes external pressure and changes the state from liquid to vapor at constant temperature and pressure. If u is the

Temperature, degrees Centigrade.	Total pressure, (Gauge pressure plus atmospheric pressure)			Heat of the liquid.		Heat of vaporization.		Heat equivalent of internal work.		Temperature, degrees Fahrenheit.

ENGLISH UNITS

change in volume the external work is *pu* and the corresponding amount of heat is *Apu* where *A* is the reciprocal of the mechanical equivalent of heat. The part of the heat of vaporization not used in external work is considered used in changing the state from liquid to vapor. The heat required for this work may be represented by $\rho = r - Apu$.

(From Peabody, Steam and Entropy Tables, John Wiley and Sons, Inc., publishers, by permission.)

Temperature, degrees Centigrade.	Heat equivalent of external work.		Entropy of the liquid.	Entropy of vaporization.	Specific volume.		Density.		Temperature, degrees Fahrenheit.
	Calories per kilogram.	B.T.U. per pound.			Cubic meters per kilo.	Cubic feet per pound.	Kilos per cubic meter.	Pounds per cubic foot.

---

* Maximum average atmospheric concentration of contaminants to which workers may be exposed for an eight-hour work day without injury to health. (American Conference of Governmental Industrial Hygienists: "Threshold Limit Values for 1954.) Where blanks appear in this column no published information was available on threshold limit values.

HIGH AND LOW TEMPERATURES

Absolute zero, −273.18° C.

M.p. of helium	−272.2° C.
B.p. of helium	−268.9
M.p. of hydrogen	−259.18
B.p. of hydrogen	−252.8
B.p. of liquid air	−192
Industrial furnaces	1700° C.
Bunsen burner	1870
Oxy-hydrogen flame	2800
Tungsten tube furnace (Forsythe)	2800
Carbon arc furnace (Forsythe)	3200

Oxy-acetylene flame	3500° C.
Tungsten arc under pressure (Luckey)	4785
Cored carbon arc (Suits)	5500
Iron welding arc (Suits)	6020
Tungsten arc, max. (Suits)	6440
Exploding wires by high voltage discharge (Anderson)	19700
The Sun (Coblentz)	6000° K.
Stars, max. estimated	30000° K.

SCALE OF FUSIBILITY

Number	Mineral	Approximate fusing point	Notes
1	Stibnite	525° C	Fuses easily in a candle flame.
2	Chalcopyrite	800° C	Fuses slowly in a gas flame.
3	Almandite	1050° C	Only finest splinters rounded in a gas flame.
4	Actinolite	1200° C	Standard-size fragments are rounded easily before the blowpipe.
5	Orthoclase	1300° C	Standard-size fragments are rounded with difficulty before the blowpipe.
6	Bronzite	1400° C	Only finest splinters rounded on points with difficulty before the blowpipe.
7	Quartz	>1400° C	Entirely infusible before the blowpipe.

CONSTANT TEMPERATURE BATHS

The following substances may be utilized between the temperatures indicated (boiling points) by using pressures from 10 to 76 cm. The second temperature given is the boiling point at the latter pressure. Several of the liquids are inflammable and must be used with caution.

Substance	Temperature °C
Ethyl chloride	−31.3 to 12.2
Ethyl ether	−12.1 to 34.5
Carbon disulfide	−4.8 to 46.3
Acetone	7.5 to 56.1
Chloroform	9.7 to 61.2
Methyl alcohol	20.62 to 64.5
Ethyl alcohol	34.4 to 78.5
Benzene	25.8 to 79.8
Water	51.7 to 100.
Toluene	51.8 to 110.5
Chlorobenzene	70.3 to 132.1
Isoamyl acetate	142.5
Bromobenzene	90.7 to 156.2
Aniline	119.4 to 184.4
Naphthalene	144.3 to 217.9
Methyl salicylate	151. to 223.3
Isoamyl benzoate	262.
Diphenylamine	221. to 302.0
Benzophenone	224. to 305.4
Mercury	261.5 to 356.9
Sulfur	330.7 to 444.6
Zinc	758. to 907.

CONVERSION TABLE FOR BAROMETRIC READINGS
(Continued)

Centimeters to Millibars

Based on the relation 1 centimeter of mercury at 0°C represents a pressure of 13.3322 millibars.

Note: Figures in last nine columns to be preceded by 9.

TEMPERATURE CORRECTION FOR BAROMETER READINGS

Brass Scale—Metric Units

To reduce readings of a mercurial barometer with a brass scale to 0°C subtract the appropriate quantity as found in the table. These values are based on the coefficient of expansion of mercury $(181792 + 0.175t + 0.035116t^2) \times 10^{-9}$, and of brass 0.0000184 per °C. Corrections are in millimeters.

CORRECTION FOR BAROMETER (Continued)

Brass Scale—English Units

Standard Temperature of scale 62° F; of mercury, 32° F. Zero correction at 28.5° F; subtract corrections above, add below. Owing to the difference in the standard temperature of English and metric scales, readings taken in inches to be reduced to centimeters should *first* be corrected for temperature.

Temp. ° F	Observed height in inches								
	23.0 in.	23.5 in.	24.0 in.	24.5 in.	25.0 in.	25.5 in.	26.0 in.	26.5 in.	27.0 in.

REDUCTION OF BAROMETER TO SEA LEVEL

The correction to be added to reduce barometric readings to "sea level" values depends principally on three factors: The temperature of the air column (assumed) from the station to sea level, the altitude of the station, and the value of the reading itself. Two tables are provided. Table I is entered with the altitude and assumed temperature and a factor "2000 m" taken out. Table II is entered with the above factor and the approximate barometer reading and the final correction taken out.

The correction is to be added. If B_0 is the corrected or sea level value; B the barometer reading at the station; C the correction,—

$$C = B_0 - B = B\,(10^m - 1)$$

The actual barometer reading at the station should be corrected for temperature of the mercury column by the usual methods before entering the tables or applying the sea level correction.

A complete explanation of the theory of the corrections and a more extended set of tables will be found in the Smithsonian Meteorological Tables.

Latitude Factor

The influence of the latitude on the value of the correction is usually negligible, being overshadowed by uncertainties in the assumed temperature of the air column. For cases where this correction is desirable the table below is provided. The value of the temperature-altitude factor "2000 m" obtained in Table I is corrected for latitude by subtracting for latitudes 0-45° and adding for latitudes from 45-90° the values found. With this corrected value of "2000 m" Table II is entered for the value of the correction.

LATITUDE FACTOR

To be used in connection with Tables I and II, either English or metric units, to obtain latitude corrections to temperature-altitude factor. For latitudes 0-45° subtract the correction. For latitudes 45-90° add the correction.

Temp.—Alt. from Table I	Latitude			
	0°	15°	30°	45°
100	0.3	0.2	0.1	0.0
200	0.5	0.5	0.3	0.0
300	0.8	0.7	0.4	0.0
	90°	75°	60°	45°

REDUCTION OF BAROMETER TO SEA LEVEL (Continued)

BULB THERMOMETER (CENT. SCALE)

temperature (dry bulb) (t°C) and the wet bulb (t'°C). It is computed for a barometrio above −10°C and between 77.5 and 71 cm Hg will usually be within the errors of observation.

U. S. Weather Bureau No. 1071

REDUCTION OF PSYCHROMETRIC OBSERVATION

For the reduction of observations with the wet and dry bulb thermometer. Assuming the relative velocity of the air to the thermometer bulbs is at least three meters per second; if t is the temperature of the air as indicated by the dry bulb, t_w, the temperature of the wet bulb, B, the barometric pressure, and E_w, the vapor tension of water corresponding to t_w, then the actual vapor tension is

$$E = E_w - 0.00066B(t - t_w)[1 + 0.00115(t - t_w)].$$

The value of the term

$$0.00066B(t - t_w)[1 + 0.00115(t - t_w)]$$

is given in the following table.

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

CONSTANT HUMIDITY WITH SULFURIC ACID SOLUTIONS

The relative humidity and pressure of aqueous vapor of air in equilibrium conditions above aqueous solutions of sulfuric acid are given below.

Density of acid solution	Relative humidity	Vapor pressure at 20°C	Density of acid solution	Relative humidity	Vapor pressure at 20°C
1.00	100.0	17.4	1.30	58.3	10.1
1.05	97.5	17.0	1.35	47.2	8.3
1.10	93.9	16.3	1.40	37.1	6.5
1.15	88.8	15.4	1.50	18.8	3.3
1.20	80.5	14.0	1.60	8.5	1.5
1.25	70.4	12.2	1.70	3.2	0.6

For concentration of sulfuric acid solution refer to tables relating density to percent composition.

SOUND ABSORPTION

TABLE I.—GENERAL BUILDING MATERIALS

The following table gives the absorption coefficients of various materials. The reverberation time is usually defined as the time required for the reverberant sound to sink to one millionth its initial intensity. This time is given in seconds by the relation, $T_0 = .05\left(\frac{V}{a}\right)$, where V is the volume of the room in cubic feet and a is the absorption. The absorption a is computed by multiplying the area in square feet of each surface by its absorption coefficient and taking the sum of these products plus the absorbing power of objects, such as seats and furnishings.

Data in the following tables have been selected largely from the Official Bulletin of the Acoustical Materials Association.

Material	Coefficients		
	128	512	2048
Floor Coverings:			
Carpet unlined	.09	.20	.27
Carpet felt lined	.11	.37	.27
Carpet, pile, on concrete, 3/8"	.09	.21	.27
Carpet, pile, on 1/8" felt, 3/8"	.11	.37	.27
Carpet, rubber, on concrete, 2/16"	.04	.08	.03
Cocoa matting	.08	.17	.30
Cork flooring slabs, glued down, 3/4"	.08	.08	.21
Cork flooring, like above, waxed and polished, 3/4"	.04	.05	.07
Cork Tile, 1/4"	.04	.06	.7
Linoleum	.02	.03	.04
Linoleum, asphalt, rubber or cork tile on concrete		.03–.08	
Rug, Axminster	.11	.20	.52
Rug, Oriental	.10	.29	.40
Hair felt:			
1" Hair felt on 2" × 1½" battens 3′ c/c	.09	.43	.33
1" Hair felt close against wall	.12	.41	.30
Hangings:			
Fabrics, hung straight:			
Light, 10 ozs. per sq. yd	.04	.11	.30
Medium, 14 ozs. per sq. yd	.06	.13	.40
Heavy, draped, 18 ozs. per sq. yd	.10	.50	82
Hard Plasters, Masonry, Wood:			
Brick wall, painted	.012	.017	.023
Brick wall, unpainted	.024	.03	.049
Clay tile, burned, 1"	.015	.028	.035
Cement		.025	

TABLE I.—GENERAL BUILDING MATERIALS (Continued)

Material	Coefficients		
	128	512	2048
Hard Plasters, Masonry, Wood:			
Concrete or terrazzo	.01	.015	.02
Glass	.035	.027	.02
Interior Stucco, smooth finish, ½″	.03	.04	.04
Marble or glazed tile	.01	.01	.015
Plaster, gypsum or lime, smooth finish on tile or brick	.013	.025	.04
Plaster, gypsum or lime, smooth finish on lath	.02	.03	.04
Plaster, gypsum or lime, rough finish on lath	.039	.06	.054
Wood blocks, pitch pine, laid in mastic, ¾″	.05	.06	.10
Wood flooring	.05	.03	.03
Wood paneling	.08	.06	.06
Combination of Accoustical Materials:			
Fibreglas Semi-rigid Panels and Boards			
Type TW-PF-2.5D 1″ thick, .23 lbs. per sq. ft.	.24	.65	.73
Type TW-PF- 4D 2″ thick, .71 lbs. per sq. ft.	.41	.99	.84
Type TW-PF- 12D 1″ thick, 1.04 lbs. per sq. ft.	.09	.79	.87
Fibreglas Metal Mesh Blankets (style HO)·			
Type TW-G-2D 1″ thick, .42 lbs. per sq. ft.	.24	.57	.70
Type TW-G-4D 2″ thick, .97 lbs. per sq. ft.	.54	.99	.88
Type TW-G-6D 2″ thick, 1.31 lbs. per sq. ft.	.55	.99	.91
Fibreglas Sewn Blankets—Muslin Faced (Styles PM 2 or FM 2)			
Type TW-G-4D 2″ thick, .69 lbs. per sq. ft.	.62	.99	.86
Openings:			
Stage, depending on furnishings		.25–.75	
Deep balcony, upholstered seats		.50–1.00	
Grills, ventilating		.15–.50	
Ventilators, 50% open	.30	.50	.50
Audience, Individual Persons, Chairs, etc.:			
Audience, seated, units per person, depending on character of seats, etc.	1.0–2.0	3.0–4.3	3.5–6.0
Chairs, metal or wood	.15	.17	.20
Pew Cushions	.75–1.1	1.45–1.90	1.4–1.7
Theater and Auditorium Chairs			
Wood veneer seats and back		.25	
Upholstered in leatherette		1.6	
Heavily upholstered in plush or mohair		2.6–3.0	
Wood Pews		.40	

TABLE II.—SPECIAL ACOUSTICAL MATERIALS

The type of material and method of mounting are indicated by symbols as follows:

TYPES OF MATERIALS

1. Cast units composed of small uniform mineral particles held together with Portland cement.
2. Cast units having a surface composed of or resembling small uniform granules. The binder may be gypsum or any other suitable mineral binder.
3. Cast units having a surface composed of or resembling irregular, rough granules. The binder may be gypsum or any other suitable mineral binder.
4. Units having a mechanically perforated surface, which acts as a covering for the sound absorbent material.
5. Units which are mechanically perforated, the perforations extending into the sound absorbent material.
6. Units having a fissured surface.
7. Compressed units composed of long wood fibers held together with a mineral binder. This type shall not have a mechanically perforated surface.
8. Felted fiber or wood pulp units which have a surface that is not mechanically perforated.

TYPES OF MOUNTINGS

1. Cemented to plaster board. Considered equivalent to cementing to plaster or concrete ceiling.
2. Nailed to 1″ × 2″ wood furring 12″ o.c., unless otherwise indicated.
3. Attached to metal supports applied to 1″ × 2″ wood furring.
4. Laid directly on laboratory floor.
5. Nailed to 1″ × 3″ wood furring 24″ o.c. and filled in between furring with 1″ mineral wool, .35 lbs./sq. ft.
6. Laid on 24 ga. sheet iron, nailed to 1″ × 2″ wood furring 24″ c.c.
7. Attached to special metal supports mounted on 2″ × 2″ wood furring.
8. Nailed to 2″ × 2″ wood furring 18″ or 20″ c.c. 2″ mineral wool between furring.

* The noise reduction coefficient is the average of the coefficients at frequencies from 256 to 2048 cycles inclusive, given to the nearest 5 %. This average coefficient is recommended for use in comparing materials for noise quieting purposes as in offices, hospitals, banks, corridors, etc.

For auditorium treatment, attention should be directed to the coefficients at 512 cycles and other frequencies as explained elsewhere.

† Unless otherwise noted, the thickness given is the thickness of the sound-absorbing element forming the face of the construction. The thickness of other sound-absorbing elements in the construction, if used, is indicated by the type of mounting.

CORRECTIONS FOR TEMPERATURE AND PRESSURE

Values found in the above table may be corrected for temperature and pressure by multiplying the values given by the appropriate correction factor found below:

Temp. ° C.	Pressure mm			
	720	740	760	780
0	1.04	1.06	1.09	1.12
10	1.00	1.02	1.05	1.08
20	0.96	0.99	1.02	1.04
30	0.93	0.96	0.98	1.01

DIELECTRIC CONSTANTS

Dielectric Constants of Pure Liquids

The values listed in the following table were obtained from National Bureau of Standards Circular 514.

The dielectric constants are intended to be the limiting values at low frequencies, the so-called static values. Temperature is the only variable considered explicitly. Usually pressure is atmospheric or insignificantly different with respect to its effect on the dielectric constant. Where data are listed above the normal boiling point, the pressure corresponds to the vapor pressure of the liquid unless otherwise noted in the footnote.

Symbols

ϵ = dielectric constant ($\epsilon_{\text{vacuum}=1}$)
t = temperature, Centigrade (°C)
T = temperature, Absolute (°K)
$a = -d\epsilon/dt$
$\alpha = -d \log_{10} \epsilon/dt$
t_1, t_2 = the limits of temperature between which a or α is considered applicable
mp = melting point
bp = boiling point
f = frequency of alternating current in cycles per second

STANDARD LIQUIDS

		$\epsilon_{20°C}$	$\epsilon_{25°C}$	a (or α)*
C_6H_{12}	Cyclohexane	2.023	2.015	0.0016
CCl_4	Carbon tetrachloride	2.238	2.228	.0020
C_6H_6	Benzene	2.284	2.274	.0020
C_6H_5Cl	Chlorobenzene	5.708	5.621	.00133(α)
$C_2H_4Cl_2$	1,2-Dichloroethane	10.65	10.36	.00240(α)
CH_4O	Methanol	33.62	32.63	.00260(α)
$C_6H_5NO_2$	Nitrobenzene	35.74	34.82	.00225(α)
H_2O	Water	80.37	78.54	.00200(α)
H_2	Hydrogen	1.228 at 20.4°K		.0034
O_2	Oxygen	1.507 at 80.0°K		.0024

* The values of a or α given in this table are derived from data in the vicinity of room temperature and are not necessarily identical with the values listed in the following sections of this table. They may be used to calculate values of dielectric constant between 15° and 30°C without introducing significant error.

INORGANIC LIQUIDS

Substance		ϵ	t°C	a (or α) $\times 10^2$	Range t_1, t_2
A	Argon	1.53_8	−191	0.34	−191, −184

* For plastics and other insulating materials, refer to table on Properties of Dielectrics.

Table of Dielectric Constants of Reference Gases at 20°C and 1 Atmosphere

The listed values $(\epsilon - 1)$ refer to the gas at a temperature of 20°C and pressure of 1 atmosphere. The values can be adjusted to slightly different conditions without introducing more than 0.1% error by use of the following equation:

$$\frac{(\epsilon - 1)_{t,p}}{(\epsilon - 1)_{20°,1\,\mathrm{atm}}} = \frac{p}{760[1 + 0.003411(t - 20)]}$$

where p = pressure in mm Hg
t = degrees C

t should be between 10 and 30°C and p between 700 and 800 mm Hg. From National Bureau of Standards Circular 537.

RESISTIVITY OF DIELECTRICS

Giving the volume resistivity ρ, the variation of the volume resistivity with temperature, given as the ratio of the value at 20° C. to that at 30° C., and the surface resistivity for various dielectrics. The surface resistivity is the resistance between the opposite edges of a centimeter square. A large part of the data are from Curtis, Bulletin of the Bureau of Standards 1915. Temperatures, unless otherwise stated, are 22° C. The numbers in parentheses refer to the source of information.

RESISTIVITY OF DIELECTRICS (Continued)

DESCRIPTION OF MATERIALS

Amberite is made by compressing scrap amber.

Bakelite. A phenol condensation product, with various fillers. The various samples were made as follows:

Number	Percent pure Bakelite	Filler	Phenolic Body	Condensing Agent
1		Paper	Cresols	Ammonia
140	50	Vegetable	Phenol	Caustic soda
150	50	Fiber	"	Ammonia
190	50	"	Cresols	"
5199	50	"	Phenol	"
5200	50	Fiber & clay	"	"
5074	35	Talc	"	Caustic soda
588	100	None	"	
1 Regular	100	None	Cresols	Ammonia

Ceresin is a waxy material refined from the mineral ozokerite, m.p. below 100° C. sp. gr. 0.91–0.97. Condensite is a phenol condensation product.

Hard fiber, soft cotton paper, treated with zinc chloride, dried and pressed.

Galalith is made from the casein of milk.

Kavalier glass is hard combustion tubing having a large potassium and calcium content.

Glyptal is an artificial resin resembling amber.

Gummon, hemit, and tegit are coal tar products.

Halowax, chlorinated naphthalenes.

Moulded mica is ground mica and asbestos with shellac.

Stabalite is a rubber compound.

Silver nitrate	350	.820
Sodium chloride fused	750	.294

DIPOLE MOMENTS

Electric Dipole Moments of Gases

Symbols used in this table are as follows:

μ = the dipole moment
A = the sum of the optical and infrared contributions to the molar polarization
R = the molar refraction. The values of R refer to the sodium D line unless accompanied by a subscript giving the wavelength in millimicrons. Bracketed terms were calculated from published data
A more complete listing of compounds may be found in N. B. S. Circular 537.

Substance	$\mu \cdot 10^{18}$ e. s. u.
Glycine ethyl ester	2.11
α-Alanine ethyl ester	2.09
α-Aminobutyric acid ethyl ester	2.13
α-Aminovaleric acid ethyl ester	2.13
Valine ethyl ester	2.11
α-Aminocaproic acid ethyl ester	2.13
β-Alanine ethyl ester	2.14
β-Aminobutyric acid ethyl ester	2.11

Accurate to ±0.01 · 10^{-18} e. s. u.
J. Wyman, Chem Rev., 1936, **19**, 213.

DIPOLE MOMENTS

Dipole Moments of Amides

Substance	$\mu \cdot 10^{18}$ e. s. u.
Urea	4.56
Thiourea	4.89
Symm.-dimethylurea	4.8
Tetraethylurea	3.3
Propylurea	4.1
Acetamide	3.6
Sulfamide	3.9
Benzamide	3.6
Valeramide	3.7
Caproamide	3.9

[a] For comprehensive list of dipole moments see Trans. Faraday Soc., 1934, **30,** General Discussion.

Dipole Moments of Some Hormones and Related Compounds in Dioxan

Substance[a]	$\mu \cdot 10^{18}$ e. s. u.
Cholestane-$3(\beta):7(\alpha)$-diol	2.31
Cholestane-$3(\beta):7(\beta)$-diol	2.55
Cholestane	2.98
Δ^5-Cholestane-$3(\beta)$ol-7 one	3.79
Androsterone	3.70
β-Androsterone	2.95
Δ^5-Androstene-$3(\beta):17(\alpha)$-diol	2.89
Δ^5-Androstene-$3(\beta):17(\beta)$-diol	2.69
Δ^5-Androstene-$3(\beta)$ol-17 one	2.46
Testosterone	4.32
cis-Testosterone	5.17
Δ^4-Androstene-3:17 dione	3.32
Isophorone	3.96

[a] Ethylenic $>C{=}C<$ in a six membered ring and conjugated with $>C{=}O$ increases the dipole moment approximately by 1 Debye. Non-conjugated $>C{=}C<$ in sterols decreases the dipole moment by approximately 0.49. Biological activity is not correlated with dipole moment. W. D. Kumler and G. M. Fohlen, J. Am. Chem. Soc., 1945, **67,** 437.

ELECTROMOTIVE FORCE AND COMPOSITION OF VOLTAIC CELLS

STANDARD CELLS

(From Smithsonian Tables.)

Name of cell.	Negative pole.	Solution.	Positive pole.	Depolarizer.	E.M.F. in volts.
Weston normal..	Cadmium amalgam...	Saturated solution of $CdSO_4$.....	Mercury. .	Paste of Hg_2SO_4 and $CdSO_4$	1.0183 at 20° C.
Clark standard. .	Zinc amalgam.......	Saturated solution of $ZnSO_4$.....	Mercury. .	Paste of Hg_2SO_4 and $ZnSO_4$.	1.4328 at 15° C.

Temperature equations:

Clark cell: $E_t = 1.4328[1 - 0.00119(t - 15) - 0.000007(t - 15)^2]$ volt

Weston cell: $E_t = 1.0183[1 - 0.0000406(t - 20) - 0.00000095(t - 20)^2 + 0.00000001(t - 20)^3]$ volt

DOUBLE FLUID CELLS

Name of cell.	Negative pole.	Solution.	Positive pole.	Solution.	E.M.F. in volts.
Bunsen.........	Amal. zinc..........	1 part H_2SO_4 to 12 parts H_2O....	Carbon...	Fuming nitric acid.........	1.94
Bunsen.........	Amal. zinc..........	1 part H_2SO_4 to 12 parts H_2O....	Carbon...	HNO_3, density, 1.38.........	1.86
Bichromate.....	Amal. zinc..........	12 parts $K_2Cr_2O_7$ to 25 parts H_2SO_4 and 100 parts H_2O.	Carbon...	1 part H_2SO_4 to 12 parts H_2O	2.00
Bichromate.. ..	Amal. zinc..........	1 part H_2SO_4 to 12 parts H_2O....	Carbon...	12 parts $K_2Cr_2O_7$ to 100 parts H_2O...............	2.03
Daniell.........	Amal. zinc..........	1 part H_2SO_4 to 4 parts H_2O.....	Copper...	Saturated solution of $CuSO_4+5H_2O$...........	1.06
Daniell.........	Amal. zinc..	5% solution of $ZnSO_4+6H_2O$....	Copper...	Saturated solution of $CuSO_4+5H_2O$...........	1.08
Daniell	Amal. zinc..........	1 part NaCl to 4 parts H_2O.....	Copper...	Saturated solution of $CuSO_4+5H_2O$...........	1.05
Grove...	Amal. zinc........ .	1 part H_2SO_4 to 12 parts H_2O....	Platinum .	Fuming nitric acid.........	1.93
Grove..........	Amal. zinc..........	Solution of $ZnSO_4$..............	Platinum .	HNO_3 density 1.33........	1.66

ELECTROMOTIVE FORCE AND COMPOSITION OF VOLTAIC CELLS (Continued)

Double Fluid Cells (Continued)

Name of cell.	Negative pole.	Solution.	Positive pole.	Solution.	E.M.F. in volts.
Grove	Amal. zinc	H_2SO_4 solution, density 1.136	Platinum	HNO_3 density 1.33	1.79
Grove	Amal. zinc	H_2SO_4 solution, density 1.14	Platinum	HNO_3 density 1.19	1.66
Grove	Amal. zinc	NaCl solution	Platinum	HNO_3 density, 1.33	1.88

Single Fluid Cells

Name of cell.	Negative pole.	Solution.	Positive pole.	E.M.F.
Dry cell	Zinc	Ammonium Chloride	Carbon with MnO_2	1.53
Leclanché	Amal. zinc	Solution of sal-ammoniac	Carbon, depolarizer: manganese peroxide with powd. carbon	1.46
Edison-Lalande	Amal. zinc	Solution of caustic potash	Copper, depolarizer, CuO	0.70
Chloride of silver	Zinc	23% sol. of sal-ammoniac	Silver, depolarizer: silver chloride	1.02

Storage Cells

Name of cell.	Negative pole.	Solution.	Positive pole.	E.M.F.
Lead accumulator	Lead	H_2SO_4 solution of density 1.1	PbO_2	2.2
Regnier (1)	Copper	$CuSO_4+H_2SO_4$	PbO_2	1.68 to 0.85, average, 1.3
Regnier (2)	Amal. zinc	$ZnSO_4$ solution	PbO_2 in H_2SO_4	2.36
Main	Amal. zinc	H_2SO_4, density about 1.1	PbO_2	2.50
Edison	Iron	KOH, 20% solution	A nickel oxide	1.1, mean of full discharge

CONTACT POTENTIALS

Potential of metal at left minus potential of metal at top in volts. The values are given for room temperature and for pressures, indicated by the superscript. Figures indicate pressure in mm of Hg, $^{\text{vac.}}$, vacuum, $^{\text{atm.}}$, atmospheric pressure. The figures are for fresh surfaces.

	Brass	Platinum	Other metals
Aluminum	$+1.04^{\text{vac.}}$ $+0.19^{\text{atm.}}$	+1.20	Fe, +0.87 Z , +0.29

Tin		+0.62	
Zinc		+0.90	

* Coconut charcoal saturated with the gas named.

DIFFERENCE OF POTENTIAL BETWEEN METALS IN SOLUTIONS OF SALTS

The table gives the difference in potential in hundredths of a volt between zinc in a normal solution of sulfuric acid and the metal named at the head of the columns in the solution named at the side. The signs given refer to the external difference of potential.

(Magnanini.)

Strength of the solution in gramme molecules per liter.	Difference of potential in centivolts.					
	Zinc.	Cadmium.	Lead.	Tin.	Copper.	Silver.

The above compilation is abridged from a complete table published in Volume 73 of the Transactions of the Electrochemical Society, but has been corrected to correspond to the 1942 atomic weights as published by the American Chemical Society and the best values obtainable for the few elements not listed in the official table; in most cases the only valence covered is that which determines the placing of the element in the periodic table, though in a few cases the most important valence from an electrochemical standpoint is given precedence, and for a few of the more important elements two or more valences are given; values for elements in the O group of the periodic system are calculated on the basis of unit valence, listed as *n*, to distinguish them from elements with a true unit valence. For uses where a more complete table is required, the reader is referred to the original publication

Digits printed in italics may, if desired, be dropped from the values, rounding them off to the nearest preceding digit; such digits have been carried as a matter of convenience and uniformity in calculating and tabulating, but are in excess of the number of significant figures in the primary data, and hence do not add to the true accuracy of the results.

[1] This value varies from the basic figure of 1.1180 mg because of the rounding off of the value of the Faraday to 96,500 coulombs; other values also differ in the same proportion.

[2] This is the second isotope of hydrogen, and is the only isotope included in the table, as no others have as yet been isolated to a sufficient degree to have their atomic weights determined.

INTERNAL RESISTANCE OF VARIOUS VOLTAIC CELLS

The internal resistance is subject to large variations; the values given can be considered only approximate.

Cell	Resistance, ohms	Cell	Resistance, ohms
Edison-Lalande...	0.03	Grove............	0.1–0.2
Daniell...........	0.85	Bunsen...........	0.1–0.2
Gravity..........	1–5	Bichromate.......	0.08–0.40
Silver chloride....	4.	Storage..........	0.004–0.02
Dry cell..........	0.05–0.10	Clark standard....	20–50
Leclanché........	0.4–0.2	Weston standard...	20–50

IONIZATION POTENTIALS

The Elements

The following table gives the ionization potentials in volts for the elements in the atomic state. The degree of ionization is indicated by the numerals I, II, etc. Doubtful values are indicated by parentheses.

COMPOUNDS

The first ionization potential of the molecules indicated is given in volts.

Compound	Ionization potential I volts	Compound	Ionization potential I volts
Br_2	12.8	CH_3Cl, methyl chloride	10.7
BrCl	12.9 (calc.)	CH_3I, methyl iodide	9.1
C_2	12	CH_4, methane	14.5
CH_2O, formaldehyde	11.3	CN	14
CH_3Br, methyl bromide	10.0	CO	14.1

IONIZATION POTENTIALS (Continued)

COMPOUNDS (Continued)

Compound	Ionization potential I volts	Compound	Ionization potential I volts
CO_2	14.4	HI	12.8
CS	10.6	H_2O	12.56
CS_2	10.4	H_2S	10.42
C_2H_2, acetylene	11.6	I_2	9.7
C_2H_4, ethylene	12.2	IBr	11.6 (calc.)
C_2H_6, ethane	12.8	ICl	11.9 (calc.)
C_6H_6, benzene	9.6	N_2	15.51
C_7H_8, toluene	8.5	NH_3	11.2

HCl	13.8	SO_2	13.1
HF	17.7 (calc.)		

NUCLEAR SPINS AND MOMENTS

Arnold L. Blum, Varian Associates

The following symbols are used in this table:

A = Mass number (number of protons and neutrons)
Z = Atomic number (number of protons)
I = Nuclear spin in units of $h/2\pi$
μ = Magnetic moment without diamagnetic correction
Q = Electric quadrupole moment in units of 10^{-24} cm^2
* = radioactive isotope

The experimental method employed for the most precise measurements of μ is indicated by the following code:

B = Electron paramagnetic resonance
C = Atomic and molecular beams
D = Microwave spectroscopy
E = Optical hyperfine structure
F = Nuclear alignment at low temperatures
G = Nuclear magnetic resonance

The number of significant figures of any quantity in the table is intended to indicate that measurements have been made to at least that order of accuracy. It should be noted, however, that differences in chemical environment can shift the measured Larmor frequency of any nuclide by amounts many times greater than the uncertainty in a nuclear magnetic resonance measurement.

RELATIVE SENSITIVITIES

This table gives sensitivities relative to the proton for nuclear magnetic resonance experiments, as computed from the following formulas:

$$(\text{Sens. at const. field}) = 7.652 \times 10^{-3}\mu^3(I + 1)/I^2,$$
$$(\text{Sens. at const. frequency}) = 0.2387\mu(I + 1).$$

They represent induced signal voltages relative to a *constant* noise input in an idealized experiment where the only quantities varied are the spins and magnetic moments of the nuclei.

The actual signal-to-noise ratio in any nuclear magnetic resonance experiment is affected by a large number of factors, including sample geometry, relaxation times, line splittings, variations in receiver sensitivity with frequency, and isotopic abundance. Whereas the above parameters vary with the experiment and the apparatus, the listed sensitivities represent the best that can be expected under absolutely optimum conditions.

Nuclide		Relative sensitivity	
		At constant field	At constant frequency
n	1	0.32	0.68
H	1	**1.00**	**1.00**
H	2	9.6×10^{-3}	0.41

ELECTRON WORK FUNCTIONS OF THE ELEMENTS

From data published up to 1954

Compiled by Herbert B. Michaelson

Preferred values for well-outgassed polycrystalline materials are indicated by an asterisk (*). Because of the anisotropy and allotropy of work function, however, the designation "preferred value" has a rather limited meaning.

Values are expressed in electron-volts.

Each value is followed by a reference to the literature.

ELECTRON PHYSICS TABLES

ELECTRON PHYSICS TABLES

Values in these tables were obtained from National Bureau of Standards Circular 571 which were prepared by L. Marton, C. Marton, and W. G. Hall.

The present tables of electron physics are suited to requirements in physics and in engineering.

V is the potential difference, in absolute volts, that is required to impart to an electron initially at rest a kinetic energy E expressed in electron volts. If E is expressed in centimeter-gram-second units of energy (ergs) then $V = (E \times 10^{-8})/e$, where e is the electronic charge in electromagnetic units.

It is often found convenient to determine the value of the momentum which is relativistically correct in terms of a formula which is of a non-relativistic form. Thus, if we write

$$p = (2em_0V^*)^{\frac{1}{2}}$$

where m_0 is the rest mass of the electron, e is the charge of the electron in emu; then V^* may be considered as the "effective relativistic potential difference" which is given by

$$V^* = V + \frac{e}{2m_0c^2} V^2$$

where c is the velocity of light.

The third column lists the quantity $H\rho$, the product of the magnetic field and the radius of curvature of the path of the electron in the plane perpendicular to the field. In these tables H is expressed in oersteds and ρ in centimeters.[1] $H\rho$ is given by

$$eH\rho = p$$

so that

$$H\rho = \sqrt{\frac{2m_0}{e}}\sqrt{V^*}$$

The next tabulated quantity is λ, the deBroglie wavelength of the electron in the absence of a magnetic field. It is given by

$$\lambda = \frac{h}{p} = h(2m_0eV^*)^{-\frac{1}{2}}$$

where h is Planck's constant.

The next column contains p^*, the momentum of the electron in units of m_0c. The following relation was used in computing these tables:

$$p^* = \frac{p}{m_0c} = \left(\frac{2e}{m_0c^2} V^*\right)^{\frac{1}{2}}$$

---

[1] Workers in this field who are accustomed to considering electrodynamics as developed from four fundamental quantities, as in the MKSA system of units, may prefer the symbol B (in gausses) because they are used to write the transverse force on an electron as $F = \text{ev} \times B$. However, in the 3-dimensional cgsem system of units H and B are indistinguishable in vacuum and the combined symbols "$H\rho$" are deeply rooted in literature.

In one column are tabulated values for E^*, the kinetic energy of the electron in units of its rest energy. This is expressed by

$$E^* = \frac{E}{m_0c^2}$$

so that

$$E^* = (p^*)^2 + 1^{\frac{1}{2}} - 1 = \frac{eV}{m_0c^2}$$

The total energy in these units W^* is tabulated in another column. This quantity bears a simple relationship to E^*,

$$W^* = E^* + 1$$

The last column contains $\beta = v/c$, the ratio of electron velocity to light velocity. In taking account of the above listed equations the following relationships are valid:

$$\beta = \frac{p^*}{W^*} = \frac{p^*}{E^* + 1} = \frac{p^*}{\sqrt{p^{*2} + 1}} = \sqrt{\frac{2eV^*}{2eV^* + m_0c^2}}.$$

The following table summarizes the notations and equations used in these tables:

Potential difference ("volt-energy")	$V = 10^{-8} \frac{m_0}{e} c^2E^*$
"Relativistic potential difference"	$V^* = V + \frac{e_{\text{emu}}}{2m_0c^2} V^2$
Magnetic field	H
Radius of curvature	ρ
Wavelength of the electron	$\lambda = \frac{h}{p}$
Momentum in units of m_0c	$p^* = \frac{p}{m_0c} = \beta W^*$
Kinetic energy in units of rest energy	$E^* = E/m_0c^2 = W^* - 1$
Total energy in units of rest energy	$W^* = E^* + 1$
Ratio of light-to-electron velocities	$\beta = v/c$
Charge of the electron	e
Rest mass of the electron	m_0
Velocity of the electron	v
Momentum of the electron	$p = eH\rho$
Kinetic energy	$E = m_0c^2E^* = \frac{vV}{10^{-8}}$
Total energy	$W = m_0c^2W^*$

RATIO TABLES FOR BRIDGE CALCULATIONS

The Leeds & Northrup Co.

$$\frac{A}{1000 - A}$$

The first table gives values of the ratio, $A/(1000 - A)$, the value of A being measured from the zero at one end of the scale. If the balance point is at 500, $A = 500$ and the ratio is unity.

RATIO TABLES FOR BRIDGE CALCULATIONS
(Continued)

$$\frac{4500 + A}{5500 - A}$$

The second table gives values of the ratio $(4500 + A)/(5500 - A)$, the value of A being measured from the 4500 division on a total scale of 10,000. If the balance point is at 5000, $A = 500$ and the ratio is unity.

CONDUCTIVITY OF STANDARD SOLUTIONS

Giving the conductivity in reciprocal ohms (mho) per cm. for NaCl, KCl, H_2SO_4 and $MgSO_4$ for various temperatures. Solutions are as follows: —

H_2SO_4, — maximum conductivity (18° C.); dissolve 378 g. of 97% acid in pure water and dilute to 1 liter. Density at 18° C., 1.223.

$MgSO_4$, — maximum conductivity (18° C.); dissolve in 1 liter of distilled water 552 g. of $MgSO_4 7H_2O$. Density at 18° C., 1.190.

NaCl, — solution saturated at all temperatures given. An excess of NaCl in distilled water, about 450 g. per liter. D = 1.2014 (18° C.).

KCl, — normal solution, 74.59 grams per liter of solution at 18° C. Dissolve 74.555 grams (weighed in air) of KCl and dilute to 1 liter. Density, 1.04492.

EQUIVALENT CONDUCTANCE OF AQUEOUS SOLUTIONS

The equivalent conductance is given in reciprocal ohms. Concentration is given in milli-equivalents of solute per liter of solution. Corrected for conductance of water except in case of the strong acids.

STANDARD CALIBRATION TABLES FOR THERMOCOUPLES

The following tables which represent the Temperature-E. M. F. functions of various thermocouples should be used with appropriate correction curves if precise results are desired. These curves must be determined for each individual couple by plotting ΔE, the difference between the observed and the standard E. M. F., against the standard E. M. F. at three or more fixed temperature points. The value ΔE as shown by such a correction curve is then subtracted algebraically from the observed E. M. F. to give the true E. M. F. reading.

In the following tables the fixed or "cold junction" is at 0° C.; when the cold junction is not maintained at 0° C. the readings of the E. M. F. must be corrected as follows: $Et = E_{(t-tc)} + Etc$ where $E_{(t-tc)}$ is the observed reading, Etc is the E. M. F. for the temperature corresponding to the cold junction temperature as read from the standard table and Et is the E. M. F. produced by the hot junction corrected to the value which would be obtained with the cold junction at 0° C. The temperature corresponding to Et is then obtained by reference to the standard table.

Since the E. M. F.-temperature function is not linear the cold junction should be maintained at a temperature very close to that at which the thermocouple was calibrated. Otherwise considerable error will result despite the above correction.

PLATINUM VERSUS PLATINUM-10-PERCENT RHODIUM THERMOCOUPLES

(Electromotive Force in Absolute Millivolts. Temperatures in Degrees C (Int. 1948). Reference Junctions at 0° C.)

THERMOELECTRIC POWER

The following table gives values of the constants A and B in the equation for the thermoelectric power

$$Q = A + Bt$$

where A is the thermoelectric power at 0°C, B the temperature coefficient and t the temperature at 0°C.

Q will be found in microvolts per °C for any metal when the appropriate constants and the temperature in °C are substituted in the equation.

The values are given with respect to lead except where otherwise indicated. Values are regarded as positive if the current flows from the metal listed to the reference metal at the cold junction.

Metal	Microvolts per °C		Temp. range °C
	A	B	
		$\times 10^{-2}$	
Aluminum, 99 % pure	− 0.4717	+ 0.2718	−200–+100

VALUES FOR THE LANGEVIN FUNCTION $\mathcal{L}(u)$

Compiled by Allen L. King

Because of random thermal rotations a dipole or dipole-like element ordinarily has an average dipole moment of zero. If it is placed in an orienting field F however it tends to align itself with the field so that the average component of the dipole moment parallel to the field equals $\bar{p}$. Classically, if the system is in thermal equilibrium,

$$\bar{p} = p_0(\coth u - 1/u) = p_0\mathcal{L}(u)$$

Here p_0 is the moment of the dipole itself and $\mathcal{L}(u)$ is the Langevin function of the argument u which equals Fp_0/kT.

$$\text{For } u \ll 1 \quad \mathcal{L}(u) = \frac{u}{3}$$

The Langevin function applies to permanent electric and magnetic dipoles.

MAGNETIC SUSCEPTIBILITY

The following tables give the specific susceptibility χ for various substances. The relation to volume susceptibility κ is shown by the equation $\chi = \kappa/d$, where d is the density of the substance. Unit of χ, 1×10^{-6} cgs electromagnetic units. Room temperature is to be understood where no other is stated. The values are positive for paramagnetic bodies, negative for diamagnetic.

MAGNETIC INCLINATION OR DIP AND HORIZONTAL INTENSITY

The mean or limiting values are given for the territory covered by the State named. The horizontal intensity is given in gausses. The table is compiled from the results of the U. S. Coast and Geodetic Survey for 1911 and 1912.

State.	Dip, degrees.		Horizontal intensity.	
Alabama	62.	to 66.	.23	to .26
Alaska	67.	74.	.16	.21
Arizona	59.		.27	
Arkansas	63.	65.	.24	.25
California	58.	62.	.25	.27
Colorado	67.	68.	.22	.23

MASS ABSORPTION COEFFICIENTS FOR X AND γ RAYS

Radiation traversing a layer of substance is reduced in intensity by a constant fraction μ per centimeter. After penetrating to a depth x the intensity is $I = I_0 e^{-\mu x}$ where I_0 is the intensity at the surface. μ/ρ is the mass absorption coefficient where ρ is the density of the material.

Values of μ/ρ for $\lambda = .005$ Å to $\lambda = 44.6$ Å. Where two values of μ/ρ for one value of λ occur they represent the maximum and minimum values at an absorption discontinuity.

Compiled by S. J. M. Allen

$\lambda = 44.6 - 2.74$ Å

λ, Å	He	C	N	O	Ne	Al	S	Cl	A

K AND L X-RAY ABSORPTION EDGES

The wavelengths in Angstroms for the K absorption edge of elements having atomic numbers 3 to 11 and 83 to 100 were calculated from critical X-ray absorption energies listed in the Review of Scientific Instruments, **23,** 523–528. (1952.)

All wavelengths for the L absorption edges were calculated from absorption energies given in the above reference.

Values for the M, N, and O absorption edges are also listed in the above reference. The wavelengths in Angstroms for the K absorption edge of the elements having atomic numbers 12 to 82 are reproduced by permission from Structure of Metals, Barrett, 2nd edition, McGraw-Hill Book Company, Inc. (1952.)

X-RAY CRYSTALLOGRAPHIC DATA*

Compiled with the collaboration of John G. Albright

The following table presents crystallographic data for about 1300 compounds. For convenience they have been separated into; elements. inorganic compounds. minerals. metal-organic compounds and organic compounds. Alloys will be found among the inorganic compounds under one or the other of the metal constituents.

The crystal system is given using abbreviations indicated below. The type of structure is indicated by reference to certain characteristic compounds. The space group is indicated by the symbols of the Shoenflies system. The dimensions of the unit cell *a*, *b*. and *c* in angstrom units are given in order followed in some cases by axial angles. The last column indicates the number of molecules per unit cell.

For an explanation of the space group symbols, structure types or other details of crystallographic data see Wyckoff: The Structure of Crystals and also Davey: Study of Crystal Structure and its Applications (p. 672).

Abbreviations: b.c., body centered; c.p., close packed; cub., cubic; dia., diamond; f.c., face centered; hex., hexagonal; monocl.. monoclinic; rhbdr.. rhombohedral; rhomb., rhombic: tetr., tetragonal; tricl., triclinic.

The Elements

Substance	System, struct. type	Space group	Lattice constants	Atoms
			a, *b*, *c*, Ax. ang	
A (−235°C)	cub., f.c.. Cu	O_h^5	5.43	4
Ag	cub., f.c., Cu	O_h^5	4.0776	4
Al	cub., f.c.. Cu	O_h^5	4.04145	4
As	hex., rhbdr.	D_{3d}^5	4.151, $\omega = 53° 49'$	2
As	rhbdr., f.c.	....	5.599, $\omega = 84° 18'$	8
Au	cub., f.c., Cu	O_h^5	4.0702	4
Ba	cub., b.c., W	O_h^9	5.015	2
Be	hex., c.p.. Mg	D_{6h}^4	2.283, ... 3 607 2.2679, ... 3.5942 (Neuburger 1933)	2
Bi	hex., rhbdr., As	D_{6h}^5	4.749, $\omega = 57° 16'$	2
Bi	rhbdr.. f.c.	....	6.578, $\omega = 87° 34'$	8
Br (−150°C)	rhomb., I	V_h^{18}	4.48, 6.67. 8.72	8
C (diamond. 18°C)	cub., f.c.	O_h^7	3.5597	8
C (graphite)	hex.	D_{6h}^4	2.455, ... 6.69	4
Ca	cub., f.c., Cu	O_h^5	5.56	4
Cb (Nb)	cub., b.c.. W	O_h^9	3.03	2
Cd	hex., c.p.. Mg	D_{6h}^4	2.973, ..., 5.606	2
Ce (α)	hex., c.p.. Mg	D_{6h}^4	3.65, ... 5.91	2
Ce (β)	cub., f.c., Cu	O_h^5	5.12	4
Cl (−185°C)	tetr.	D_{4h}^{16}	8.56, ... 6.12	8
Co (α)	hex., c.p.. Mg	D_{6h}^4	2.514, ..., 4.105	2

X-RAY CRYSTALLOGRAPHIC DATA (Continued)

Substance	System, struct. type	Space group	Lattice constants a, b, c, Ax. ang.	Mol.
Manganese acetylacetone	monocl.	....	14.1, 7.68, 16.5, $\beta =$ 99° 24′	4
Potassium				
acid chloromaleate	rhomb.	V_h^{16}	7.62, 15.74, 10.95	8
bitartrate	....	....	7.614, 10.70, 7.80	4
borotartrate	rhomb.	V_2	4.88, 18.00, 7.65	2
chlorosulfoacetate	rhomb.	V_h^{14}	8.58, 8.60, 23.76	8
mesotartrate + $2H_2O$	tricl.	....	7.02, 6.90, 11.02, $\alpha =$ 95° 44′, $\beta =$ 102° 52′, $\gamma =$ 61° 46′	2
rhodium oxalate	hex.	D_3^4 or D_3^6	11.28, ..., 20.25	6
Rubidium tartrate	hex.	D_3^4 or D_3^6	7.17, ..., 13.19	3
Scandium acetylacetone	rhomb.	C_{2v}^7 or V_h^{13}	8.20, 13.52, 16.15	4
Silicon tetraphenyl	tetr.	V_d^4 or D_{4h}^9	11.50, 6.97	2
Silver uranyl acetate	tetr.	C_{4h}^6	12.98, ..., 28.10	16
Sodium				
acid acetate	cub.	T_h^7	15.9	24
palmitate (α) (below 42.7°C)	rhomb.	D_{2h}^9	8.06, 9.24, 47.70	8
palmitate (β) (above 42.7°C)	monocl.	C_{2h}^3	7.83, 5.40	4
stearate (α) (below 51.5°C)	rhomb.	D_{2h}^9	8.04, 9.24, 51.77	8
stearate (β) (above 51.5°C)	monocl.	C_{2h}^3	7.80, 5.33,	4
uranyl acetate	cub.	T^4	10.670	4
Strontium				
formate	rhomb.	V^4	6.86, 8.72, 7.24	4
formate + $2H_2O$	rhomb.	V^4	7.30, 11.99, 7.13	4
Thallium mesotartrate	tricl.	....	13.26, 16.12, 7.63, $\alpha =$ 75° 54′, $\beta =$ 86° 37′, $\gamma =$ 82° 14′	4
Tin tetraphenyl	tetr.	V_d^4	11.83, ... , 6.42	2
ORGANIC COMPOUNDS				
Acenaphthene	rhomb.	.. ..	8.32, 14.15, 7.26	4
Acetaldehyde ammonia	hex.	D_{3d}^5	8.18, $\alpha =$ 84° 50′	6
Acetamide	hex.	C_{3v}^6	8.05, $\alpha =$ 91° 17′	6
Acetonyl pyrrole	tetr.	C_4^2 or C_4^4	10.09, ..., 23.85	4
Acetoxybisnorallocholanic acid	monocl.	....	57.1, 7.69, 19.45, $\beta =$ 97.5°	
Acetylenedicarboxylic acid	monocl.	....	7.88, 9.04, 6.62, $\beta =$ 111° 6′	4
Acetylsalicylic acid	monocl.	C_{2h}^5	11.37, 6.54, 11.37, $\beta =$ 95.7°	4
Adipic acid	monocl.	C_{2h}^5	10.27, 5.16, 10.02, $\beta =$ 137° 5′	2

Substance	System, struct. type	Space group	Lattice constants	Mol.
			a, b, c, Ax. ang.	
Aminoazobenzene (p)	monocl.	....	13.69, 5.604, 14.18, β = 81° 49′	4
Aminophenol (o)	rhomb.	V_h^{15}	7.26, 7.71, 19.51	8
Aminophenol (m)	rhomb.	C_{2v}^4	6.14, 11.10, 8.38	4
Aminophenol (α − p)	rhomb.	C_{2v}^5	8.25, 5.32, 13.06	4
Aminophenol (β − p)	rhomb.	C_{2v}^1	12.07, 11.85, 5.82	6
Anthracene	monocl.	C_s^4	8.58, 6.02, 11.18, β = 125°	2
Anthranilic acid I	rhomb.	V_h^{11}	....	8
Anthranilic acid II	rhomb.	V_h^5	....	8
Anthraquinone	rhomb.	V_h^{13}	12.05, 15.05, 2.69	2
Arabinose	rhomb.	V^4	6.48, 19.30, 4.81	4
Azelaic acid (α)	monocl.	C_{2h}^5	9.72, 4.83, 27.14, β = 129° 30′	4
Azelaic acid (β)	monocl.	C_{2h}^2	5.61, 9.58, 27.20, β = 136° 30′	4
Azobenzene	monocl.	C_{2h}^5	12.65, 6.06, 15.60, β = 114° 24′	4
Azotoluene (o)	monocl.	C_{2h}^5	13.93, 6.604, 14.55, β = 101° 4′	4
Azoxyphenetol (p)	monocl.	....	15.9, 5.42, 17.5, β = 94° 20′	
Behenolic acid	monocl.	C_{2h}^4 or C_{2h}^5	9.551, 4.686, 59.10. β = 53° 30′	4
Benzanthracene (1:2)	monocl.	C_2^2	7.91, 6.43, 23.96, β = 99°	4
Benzanthracene (2:3)	tricl.	....	7.94, 6.02, 13.5, α = 80° 40′, β = 67° 50′, γ = 92° 40′	2
Benzene (−20°C)	rhomb.	V_h^{15}	9.76, 7.39, 6.85	4
Benzene hexabromide	monocl.	C_{2h}^4	8.44, 4.04, 17.3, β = 116° 30′	2
Benzene hexachloride	monocl.	C_{2h}^4	8.10, 3.86, 16.68, β = 116° 50′	2
Benzil	hex.	D_3^4 or D_3^6	8.15, ..., 13.46	3
Benzoic acid	monocl.	....	5.44, 5.18, 21.6, β = 97° 5′	4
Benzophenone	....	D_2^4	10 17. 12.06, 7.98	4
Brassylic acid	monocl.	C_{2h}^5	9.63, 4.82, 37.95, β = 128° 20′	4
Bromostearic acid	monocl.	C_{2h}^4 or C_{2h}^5	11.039, 4.904, 52.84, β = 43° 17′	4
Carotene (β)	monocl.	C_{2h}^5	7.75, 9.5, 25.0, β = 105°	2
Catechol	monocl.	C_{2h}^3	17.46, 10.74, 5.48, β = 94° 15′	8
Cellobiose (d)	monocl.	C_2^2	5.00, 13.2, 11.1, β = 90°	2
Cellulose	tetr.	....	7.79, ..., 10.26	4
Cellulose hydrate	monocl.	....	8.14, 10.3, 9.14, β = 62°	4
Cellulose natural	monocl.	....	8.3, 10.3, 7.9, β = 84°	

Substance	System, struct. type	Space group	Lattice constants	Mol.
			a, *b*, *c*, Ax. ang.	
Cetyl palmitate.......	monocl.	C_{2h}^5	5.61, 7.42, 88.79, β = 61.3	4
Chlorobromobenzene (*p*)	monocl.	....	15.15, 4.12, 5.81, β = 113° 9′	2
Chloronaphthalene tetrachloride (α)	monocl.	....	8.245, 10.1, 15.78, β = 116° 12′	4
Cholestane dibromide..	....	....	20.8, 11.27, 10.72, β = 90°	
Cholestanedione.......	....	....	19.6, 7.62, 7.9, β = 93°	
Cholesteryl acetate....	....	....	16.3, 9.35, 17.5, β = 73.6	
Chrysene.............	monocl.	C_{2h}^6	8.34, 6.18, 25.0, β = 115.8°	4
Cinnamic acid (*trans*)..	monocl.	....	11.65, 14.10. 4.26, β = 98° 36′	4
Cyanuric acid.........	pseud. rhomb.	C_{2h}^6	7.90, 6.74, 9.04, β = 90°	4
Cyanuric triazide......	hex.	....	8.73, ..., 5.96	2
Cyclohexane-α-diol-1,2	rhomb.	V_h^{15}	7.62, 8.55, 19.57	8
Cyclohexane-β-diol-1,4	monocl.	C_{2h}^5	6.32, 21.2, 7.27, β = 96.0°	6
Cyclohexane-γ-diol-1,2	monocl.	C_{2h}^6	19.13, 9.92, 7.23, β = 103.9°	8
Cyclohexyl diacetate-1, 4 (β)	monocl.	C_{2h}^5	13.56, 5.83, 6.72, β = 107.4°	2
Cyclopentenophenanthrene (1: 2-)	monocl.	C_{2h}^5	18.38, 5.83, 23.61, β = 114.3°	8
Dibenzalpentaerythritol	hex.	D_6^4	6.03, ..., 36.7	3
Dibenzcarbazole (1: 2: 5: 6-)	rhomb.	D_{2h}^{15} (?)	31.10, 9.65, 26.61, β = 90°	24
Dibenzcarbazole (1: 2: 7: 8-)	monocl.	C_{2h}^2 (?)	14.63, 7.64, 12.08, β = 96°	4
Dibenzcarbazole (1: 2: 7: 8-)	rhomb.	D_2^7 (?)	10.27, 10.26, 50.5, β = 90°	16
Dibenzcarbazole (3: 4: 5: 6-)	rhomb.	D_2^5 (?)	14.07, 6.10, 15.36, β = 90°	4
Dibenzyl.............	monocl.	C_{2h}^5	12.82, 6.18, 7.74, β = 116°	2
Dibromobenzene (*p*)...	monocl.	....	15.46, 4.11, 5.80, β = 112° 38′	2
Dibromotetramethylethane (*sym.*)	tetr.	....	10.45, ..., 8.14	4
Dichlorobenzene (*p*)...	monocl.	....	14.83, 4.10, 5.88, β = 112° 30′	2
Dichloronaphthalene tetrachloride	monocl.	C_s^4	7.8, 12.3, 13.9, β = 116° 14′	4
Dicyanodiamide.......	monocl.	C_{2h}^3	13.8, 4.4, 6.2, β = 90° 35′	4
Diethyl phthalyl ketone	tetr.	D_{4h}^{10}	7.25, ..., 20.47	4
Diiodoethane (*sym.*)...	monocl.	C_{2h}^5	....	2
Diiodoethane (*sym.*)...	rhomb.	V_h^{18}	7.582, 12.897, 5.810	4
Diiodoethylene (*sym.*).	monocl.	C_{2h}^5	....	2
Diiodoethylene (*sym.*) .	rhomb.	V_h^{18}	7.280, 13.310, 5.553	4
Dimesityl...........	monocl.	C_{2h}^5	8.21, 8.58, 22.25, β = 96° 30′	4

Substance	System, struct. type	Space group	Lattice constants a, b, c, Ax. ang.	Mol.
Dimethyldiethyl ammonium chlorostannate	tetr.	....	9.06, ..., 14.12	2
Dimethylethyl sulfonium chlorostannate	cub.(?)	....	12.80	
Dimethylurea (1, 2)...	rhomb.	C_{2v}^7	4.53, 10.9, 5.14	2
Dinitrobenzene (o)	monocl.	C_{2h}^5	7.95, 13.0, 7.45, β = 112° 7′	4
Dinitrobenzene (m)....	rhomb.	V_h^{16}	13.3, 14.2, 3.82	4
Dinitrobenzene (p)....	monocl.	C_{2h}^5	11.3, 5.55, 5.8, β = 92° 18′	2
4, 6-Dinitro-1, 3-xylol..	monocl.	C_{2h}^2	11.5, 5.49, 7.2, β = 98°	2
Diphenic acid.........	rhomb.	....	14.12, 11.90, 13.75	8
Diphenyl.............	monocl.	C_{2h}^5	8.11, 5.67, 9.57, β = 94° 30′	2
Diphenylbenzene (p)..	monocl.	....	8.08, 5.60, 13.59, β = 91° 55′	2
Diphenylbutadiene....	monocl.	C_{2h}^2	7.71, 11.70, 13.31/sin β, β = 97°	
Diphenylfurazane....	....	D_2^4	11.89, 12.95, 6.99	4
Diphenylglyoxime (α).	monocl.	C_{2h}^6	25.08, 8.68, 11.92	8
Diphenylglyoxime peroxide	monocl.	C_{2h}^5	12.85, 6.27, 14.96	4
Distearin (α, α')......	hex. (?)	....	81.5, ..., 10.8	48
Dulcitol..............	monocl.	C_{2h}^5	8.61, 11.60, 9.05, β = 113° 45′	4
Durene..............	monocl.	C_{2h}^5	11.57, 5.77, 7.03, β = 113.3°	2
Elaidic acid..........	tetr. (?)	....	26.5, ..., 10.3	16
Ephedrine hydrobromide (d)	rhomb.	V^4	24.68, 6.93, 6.78	
Ephedrine hydrobromide (l)	monocl.	C_2^2	12.74, 6.20, 7.62, β = 100° 48′	
Ephedrine hydrochloride (d)	rhomb.	V^4	25.49, 6.48, 6.91	
Ephedrine hydrochloride (l)	monocl.	C_2^2	12.64, 6.15, 7.34, β = 102° 6′	
Ephedrine hydroiodide (d)	rhomb.	V^4	11.39, 6.83, 15.62	
Ephedrine hydroiodide (l)	rhomb.	V^3	25.66, 7.33, 19.14	
Ergosterol acetate.....	....	....	34.8, 7.58, 10.48, β = 92.6°	
Ergosterol acetate-maleic anhydride I	monocl.	C_2^2	31.1, 9.58, 10.60, β = 95.0°	
Ergosterol acetate-maleic anhydride II	monocl.	C_2^2	32.2, 7.91, 25.3, β = 92.1°	
Erythritol (i)........	tetr.	C_{4h}^6	12.76, ..., 6.83	8
Ethane..............	hex.	D_{6h}^4	4.46, ..., 8.19	2
Ethylene (−175°C)...	rhomb.	....	6.46, 4.87, 4.14	2
Ethylene diamine sulfate	tetr.	D_4^4 or D_4^8	5.96, ..., 17.99	4
Ethylene oxide dicarboxylic acid (cis.)	monocl.	C_{2h}^6	21.50, 6.90, 6.89, β = 91° 10′	8

LIGHT

PHOTOMETRIC QUANTITIES, UNITS AND STANDARDS

Photometric quantities and units are also given in the section Quantities and Units under the sub-division Light.

Candle (or International Candle). The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Candle (new unit). $\frac{1}{60}$ of the intensity of one square centimeter of a blackbody radiator at the temperature of solidification of platinum (2,046°K).

Foot-candle. Foot-candle = 1 lumen incident per ft^2 = 1.076 milliphots = 10.76 lux.

Lumen. The lumen is the unit of luminous flux. It is equal to the flux through a unit solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Illumination. Illumination is the density of the luminous flux on a surface. It is the quotient of the flux by the area of the surface when the latter is uniformly illuminated.

Least Mechanical Equivalent of Light. One lumen at the wavelength of maximum visibility (0.556μ) equals 0.00161 watts (= 0.000385 gram calories per sec.); one watt at the same wavelength equals 621 lumens.

Relative Visibility. The relative visibility factor for a particular wavelength is the ratio of the visibility factor for that wavelength to the maximum visibility factor.

Values of the relative visibility are given as a part of the specification of the standard observer under Colorimetry.

Efficiency of a Source of Light. The efficiency of a source is the ratio of the total luminous flux to the total power consumed. In the case of an electric lamp it is expressed in lumens per watt.

Spherical Candlepower. The spherical candlepower of a lamp is the average candlepower of the lamp in all directions in space. It is equal to the total luminous flux of the lamp in lumens divided by 4π

Lambert is the unit of brightness equal to $1/\pi$ candle per square centimeter.

Footlambert is the unit of photometric brightness (luminance) equal to $1/\pi$ candle per square foot.

FLAME STANDARDS

Value of Various Former Standards in International Candles

Standard Pentane Lamp, burning pentane......	10.0	candles
Standard Hefner Lamp, burning amyl acetate..	0.9	"
Standard Carcel Lamp, burning colza oil.......	9.6	"

The *Carcel unit* is the horizontal intensity of the carcel lamp, burning 42 grams of colza oil per hour. For a consumption between 38 and 46 grams per hour the intensity may be considered proportional to the consumption.

The *Hefner unit* is the horizontal intensity of the Hefner lamp burning amyl acetate, with a flame 4 cm. high. If the flame is l mm. high, the intensity $I = 1 + 0.027(l - 40)$.

EFFICIENCIES OF ILLUMINANTS

Compiled by J. M. Smith and C. E. Weitz

The rating listed is the commercial rating of the lamp. The absolute efficiency is the equivalent power in light flux (0.556μ) per watt input. Efficiency is given in lumens per watt input.

Lamp	Rating, or Specification	Eff.	Ab. Eff.

FLAME SPECTRA

Compiled by T. G. Kennard

Listed below are the prominent lines and bands given by volatile compounds when introduced into a gas flame. Additional, weaker lines are often observed. Wave lengths are stated in ångstroms, and in the case of bands refer to the position of the band head. Bands are designated by the symbol (b); the most sensitive or persistent lines or bands are designated by P.

(2.997928 ± .000004) × 10^{10} cm/sec (Bearden and Thomsen 1955)

WAVE LENGTH OF THE PRINCIPAL LINES IN THE EMISSION SPECTRA OF THE ELEMENTS

SECTION I

Ultraviolet below 2000 A

Wave lengths are stated in angstroms

1 angstrom (A) = 10^{-8} cm = 10^{-4} microns (μ) = 10^{-1} millimicrons (mμ) = 100 $\mu\mu$

Intensities of lines are indicated by the numbers 1 to 10, the latter, the higher intensity, except as otherwise indicated.

Characteristics of the lines are indicated by symbols as follows:

I, II, III etc indicate lines produced by the neutral, ionized or doubly ionized atom respectively.

$_2$, $_3$, $_4$, etc. unresolved lines of 2, 3, or 4 components

n broad or nebulous
N very broad and diffuse
p persistent lines
P the most sensitive of the persistent lines
r easily reversed
R wide, self reversed

SECTION II

2000 to 10,000 A

Wave lengths are given in angstroms
Intensities are given according to the M. I. T. Wave length Tables.
Characteristics of the lines are indicated by symbols as follows:

bh band head
d double line
l shaded or displaced to longer wavelengths (asymmetrical)
m mean value
n hazy, diffuse, nebulous
r narrow or wide self-reversal
s shaded or displaced to shorter wavelengths (asymmetrical)
w wide or complex
W Very wide or complex
( ) Discharge tube intensity
I line classified as emitted by normal atom
II line classified as emitted by singly ionized atom
